Q. Is it free from political changes—a change in administration does not affect it?—A. No; men are not changed for political reasons.

Q. (By Mr. A. L. HARRIS.) Do I understand that the State experiment stations experiment on diseases and suggest remedies for live stock?—A. There are quite a number of stations that have veterinarians permanently and a staff of investigators. I could not say just how many of them, but the principal stations have.

Q. Is there a greater disposition now to investigate diseases of animals than a few years ago?—A. I think it is increasing all the time.

Q. Is the per centum of loss now so great as heretofore?—A. I think the loss from some diseases is as great; in others it is not. For instance, the loss from hog cholera, I suppose, is as great as it ever was; that is, I do not know that the percentage is quite as great, but the number lost is as great, because there are more swine. I think that by following the hygienic regulations which have been recommended by the experiment stations and by the Department of Agriculture they have probably lessened the percentage of loss somewhat, but there has never been very much impression made on that disease, which causes the greatest loss, perhaps, of any disease attacking our animals in this country. Of the other diseases, glanders is probably just as prevalent as it was 10 years ago; tuberculosis is more prevalent, and, taking the country over, it is increasing all the time.

Testimony closed.

WASHINGTON, D. C., January 24, 1901.

TESTIMONY OF DR. L. O. HOWARD,

Chief Entomologist of the United States Department of Agriculture.

The commission met at 10.50 a. m., Mr. Farquhar presiding. At that time Dr. L. O. Howard, of Washington, D. C., chief entomologist of the Department of Agriculture, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Give your name and address and official position.—A. L. O. Howard, chief entomologist of the United States Department of Agriculture, Washington, D. C.

Q. (By Mr. A. L. HARRIS.) You may state how long you have been connected with the Department of Agriculture.—A. Since the fall of 1878.

Q. And what is your general field of inquiry?—A. Entirely relating to the economic aspects of the work of insects, especially in relation to agricultural products.

Q. What progress has been made in economic entomology since you have been connected with the Department?—A. Do you mean as to practical results?

Q. As to practical results.—A. That is a big question, and it would require volumes to show it as it ought to be shown: it would require several hours to tell it.

Q. You might in a very brief way state the progress that has been made.—A. The whole subject of the injuries of insects is more important than is generally realized. We have an annual loss to crops by the ravages of insects of something like \$300,000,000, and live stock suffers severely. When economic work really began in this country—that is to say, with the foundation of the Department of Agriculture—we did not know of a single good reliable remedy for any injurious insects, not even with the great pests like the Hessian fly and the chinch bug, not even for the fruit pests like the codling moth—that is, the apple worm—and the plum curculio. At the present time I think it is safe to say we have a fairly good remedy for every insect of economic importance. When I say fairly good remedy, I do not mean a remedy which can be put into effect without some trouble and without some cost on the part of the farmer. When we consider the question of remedies we must consider the ease of application and the cost of application, as

well as the efficacy of the remedy itself against the insect. The General Government now expends \$30,000 a year in support of my branch of the service in the Department of Agriculture. Out of the 45 States 30 of them have State entomologists, who are investigating insects in their particular localities, and publishing bulletins on the results of their work and the remedies which they have found out and which other men have found out. There have been some estimates as to the amount of money which is actually saved by the work which has been done in the way of remedies. Dr. James Fletcher, the Dominion entomologist of Canada, speaking before the Royal Society of Canada, made the statement that the United States led the world in the subject of economic entomology, and that in all probability the damage to agricultural products by insects, were it not for the practical results of the labors of economic entomologists, would be twice as great as it is. A criticism of estimates of the loss in dollars and cents is that when there is a widespread outbreak of insects it reduces the sum total of the crop to a very great extent, but the farming class as a whole does not lose so much on account of the enhanced price of the remainder. When you come to estimate the loss of the wheat crop, and then get the market price and reduce it down to dollars and cents, you will find when the price goes up the loss to the whole country is not so great; but nevertheless that increase in price means an economic loss to the country at large, and it was on that basis that the estimate of \$300,000,000 was made.

Q. From what insect does the agriculturist sustain the greatest loss—what character of insect?—A. I think that lies between three distinct species—the codling moth or apple grub, the Hessian fly, and the chinch bug. I think the annual loss by these insects together would amount to \$60,000,000.

Q. Can you give the sections of the country that sustain the greatest loss, say from the codling moth?—A. The great apple-growing regions: the greatest apple-growing regions suffer the greatest loss. Of course that depends also on the general use of remedies. Certain sections of the country, like Michigan, used to suffer great loss. Now they have introduced remedies very generally. They first took up the banding of trees, and then they took up spraying, and Michigan does not suffer such great losses as it did before that time. Other regions also suffer, which are not successful, and have not taken up the question of remedies as thoroughly as have Michigan and western New York, some portions of Virginia, and other regions.

Q. It is thought by some localities that suffer most that the other localities that suffer less are protected in some way by climate or soil or something of that sort. Is that so?—A. That is so to some extent. Insects have a certain range, governed largely by temperature, elevation, and so on. For example, the San Jose scale, a very important insect, which has been the basis of nearly all the State legislation within the last 10 years on the subject of insects, will not go above a certain point—north of certain points—and will not flourish in regions where there is less than a certain total amount of summer heat. That insect, which is one of the worst enemies to orchards that we have, in many cases killing large orchards of peaches and plums and young peach, plum, apple, and pear trees, is at its worst in Maryland and Virginia. Up in central New York it does not get so numerous, because there is less summer heat. In northern Michigan it does not flourish, but in a strip along the southern part it does, and in Ohio it is quite bad.

Q. You think spraying is a very important remedy against the codling moth?—A. And against many other insects it is a most important remedy, as against the plum curculio and against all scale insects, different substances, however, being used on crops and against different insects.

Q. Does the black knot come under your investigation?—A. It is a fungous disease, and is not caused by insects.

Q. How far has the San Jose scale spread east?—A. It is present, I think, in most of the fruit-growing States at the present time. It is found in Massachusetts, it is found abundantly in Connecticut, and recently made its appearance in Rhode Island. It is found in all the other Eastern and Central States. In the West it is found in California, Washington, Oregon, and Idaho. It is not found in that group running from Kansas and Iowa west to California, and is not known in Colorado and in Nebraska.

Q. Does it continue to spread?—A. Yes; largely for the reason that while certain States—there are now 21 of them—have passed rigid inspection laws which provide that no nursery stock shall come into their States without the certificate of an official inspector or entomologist that it has been examined and found free from scale, there are still many States that have not passed such laws, and the result is that these States have become dumping grounds for all sorts of infested nursery stock. Here is an advertisement from the Cumberland Nurseries, of Nashville, Tenn., of a trustee's sale of nursery stock by the Nashville Trust Com-

pany. One paragraph in this says, "It is proper to state that the 'scale' has been detected in the nurseries." And this letter which accompanies this circular came to me yesterday from an entomologist connected with the Kansas Agricultural College: "My attention has just been called by a Kansas nursery company to the inclosed circular. This firm is much exercised concerning the possible circulation of such stock upon the open market. I have written them that since Kansas is without quarantine laws the State has no means of preventing the importation of such goods. It has occurred to me, however, that you might care to know of the possible exchange of such infested stock." This is just an instance of how scale-infested stock may be thrown into Kansas and similar unprotected States.

Q. What is thought to be the medium by which the San Jose scale spreads?—A. Almost entirely on nursery stock. We do not know exactly where it first came from, but it was first discovered near San Jose, Cal., on the grounds of Mr. James Lick. He was importing plants from all parts of the world at that time. It is suspected to have come from Japan, and then spread all over California, and was considered to be the most destructive scale in existence. About 1889 some Japanese plum stock was imported into New Jersey. The scale was carried East on that stock, but it was not recognized, and that stock and others which had become infested from it were sold all over the Eastern States. The fruit growers did not notice it, and entomologists did not have it called to their attention until the fall of 1893, when some of the stock was sent up from Charlottesville, Va., and then we found for the first time that this serious pest was in the East. Since then we have found that it was generally distributed by New Jersey nurseries, and other nurseries bought their stock from them and continued the spread of the scale. As soon as we found it out we began to send circulars and publish widely the fact that the scale was being distributed. Then the States began to take it up, and began to pass these inspection laws preventing the entrance into the State of any nursery stock unless it was inspected and found to be free from scale.

Q. (By Mr. FARQUHAR.) What insecticide is used in this nursery stock?—A. It is exposed to the fumes of hydrocyanic gas, and in some States a certificate that it has been fumigated by this gas is required. The best remedy depends on the part of the country. In California it is found that a wash of lime, sulphur, and salt works admirably. But the success of that remedy depends on the weather; it works well particularly in a long dry spell. In wet weather it is found inefficacious because the rains wash it off. In the East we have two remedies; one is whale-oil soap and water, a very strong solution; that is efficacious in some cases; and in others, in places where that is not efficacious, they are now advocating crude petroleum, put on the trees with great care only on sunny days, and washed on very lightly indeed or sprayed on.

Q. (By Mr. A. L. HARRIS.) What time is that applied?—A. Applied in the winter time. That remedy is now advocated very strenuously by the State entomologists of New Jersey and West Virginia.

Q. Is there any law that will compel the nurseryman to so prepare his trees before sending them out?—A. There are laws to compel them to submit them to the action of the gas, but not to treat them in other ways.

Q. What is the condition at the present time in regard to the gipsy moth; what territory does that cover?—A. It has spread to some slight extent since the State of Massachusetts stopped its appropriations. The State was appropriating \$150,000 to \$200,000 annually for the work of the so-called gipsy-moth committee. Last winter the legislature refused to make any more appropriations, and, although the insect had been reduced to almost harmless numbers by the work of previous years, it is now beginning again to spread. New colonies are being found. It has not as yet gone far outside of the old limits around Boston, and has not yet crossed over into New Hampshire, although it is very close to the New Hampshire line near Manchester.

Q. Has any effort been made to have the Federal Government assist in the expense of destroying the gipsy moth?—A. Several years ago a committee from Massachusetts came down, and Senator Lodge introduced a measure in the Senate to appropriate \$40,000 to assist in the work. It was in the form of an amendment to the agricultural appropriation bill. The House did not concur in the amendment, and it was thrown out in the conference committee, and so nothing has ever been done by the General Government.

Q. Do you look upon it as of sufficient importance for the Federal Government to interfere?—A. I think it would be well to wait for a year or two so as to judge something of the rapidity of its spread. It is not an insect that spreads very rapidly.

Q. (By Mr. FARQUHAR.) Have we any national law in the line of quarantine against insects?—A. There is no such law.

Q. Have you ever studied out whether it is possible for the National Govern-

ment to make a law of that kind?—A. There are a number of foreign governments which have made such laws which have quarantined against the United States. There has been a quarantine bill in Congress for the last 3 years, which came near passing last session, having been reported favorably by the House Committee on Agriculture. There is an admirable State quarantine in California against insects brought from abroad. They have a quarantine officer at San Francisco who boards every vessel that comes in and looks it over for anything which may possibly carry injurious insects on nursery stock, and everything in the vegetable line; and if insects are found the stock is fumigated or destroyed. The authority of the law and the officers is conceded in the highest court of California. It has been sustained. That law protects California for objects that are intended for ultimate delivery in the State of California. It does not protect the rest of the country. When the inspector finds a large box of plants from Japan, which is consigned to New Jersey or Kentucky, he notifies me and I immediately notify the State officers in those States and they cause an inspection on its arrival, if they have the authority to do so. But in certain States, as in Massachusetts, they have not authority to do so. In Massachusetts, for example, they are large importers of ornamental plants from Japan. I am notified, I notify the State board of agriculture, and they notify the importers, and if they feel like it they cause the stock to be fumigated, but if they do not feel like it they are not obliged to fumigate. This quarantine bill has been before Congress in one form or another for 3 years. A new one, just introduced by Senator Perkins, provides that the Secretary of Agriculture shall have power to quarantine against any other country absolutely if he feels that there is reason to believe that some injurious insects are likely to come in, and he has also power to designate certain ports where nursery stock must be imported and where they will be subject to inspection provided they are not accompanied by a certificate from some competent official of the government from which they are sent. It seems a very desirable thing that such a regulation should be made by the General Government. We have now perhaps 75 kinds of insects which everybody knows and which everybody fears, insects I would call of first-class importance, and more than half of these have been imported from abroad; less than half of them are indigenous to this country, and they have come in very largely through this unrestricted commerce in plants and are still coming in every year. The hop-plant louse, an insect which annihilated the hop-growing industry in the State of Wisconsin, and which occasionally destroys the crop in the great hop-growing regions in New York, came over in just that way. The Hessian fly we were just talking about came over in the straw bedding of the Hessian soldiers in the Revolutionary war.

Q. Is it a historical fact that the Hessian fly came over with the Hessian troops or is it an expression of opprobrium against the Hessian troops?—A. It is disputed. That explanation has been made by some, but it is disputed by others. It is one of those things which we can not possibly decide at this late date. It is a way in which they might have come; there is no question about that. That term of opprobrium is rather a common thing with other insects. For instance, the harlequin cabbage bug in Texas is known as the third-party bug. In Georgia, after the war, the same bug was known as the Abe Lincoln bug. That is really aside; it does not belong in the testimony.

Q. (By Mr. A. L. HARRIS.) What objections are urged to the passage of the pending bill?—A. It was opposed by the nurserymen at first, because they thought—some of them thought—that as most of their stock arrives in the cold months of the year it might be injured by being opened for inspection. I do not know of any other good argument against it. The quarantine features of the bill are being specially urged by California interests, which are united and greatly in fear of a maggot which infests the oranges in Mexico, which has not been introduced yet in California. Passing through Mexico you pick up an orange on the table and you find maggots in it. That thing occurs in most parts of Mexico. Now, there is great danger that this insect may be established in California before the California oranges come on the market, say in early October and early November. The oranges you find then are Mexican oranges, brought from Mexico. Now, suppose those oranges are thrown aside, the maggots transform to flies, and they come out and sting the California oranges; see what an injurious thing it would be? They want this bill passed so that the Secretary of Agriculture can quarantine against Mexican oranges. Of course the Mexicans say the whole thing is overrated, that the insect is not so widespread, and it is simply an effort of the Californians to avoid the competition of Mexican oranges.

Q. What effect is the worm having on the Mexican crop?—A. I do not know that we have any figures on the Mexican crop, but I have on two occasions sent two men all over Mexico just to find out whether the Mexicans were right and to see what it amounted to, and we found that it occurs in oranges all over Mexico

except in the State of Sonora west of the Sierra Madre Mountains; that State seems to be exempt. Elsewhere any orange you pick up is liable to contain these maggots.

Q. Does it destroy the orange or destroy its value?—A. Both.

Q. Or injure its value?—A. Both. The early oranges drop, a great many of them, as a result of that worm; they decay and drop from the trees. The insect has several generations; at first they attack the younger oranges; later they do not make their presence in the fruit evident before the orange is picked and put on the market.

Q. You feel it is important that the American orange grower should have some protection?—A. I do; it is very important. I remember in the Florida freeze in 1896, when so many orange trees in Florida were killed, people in the hotels who went down there for the winter found Mexican oranges on the table with maggots in them. The majority of Mexican oranges, however, do not come to the orange-growing regions. Many of them are shipped straight through to Kansas City or Chicago. Of course, there is no danger then, but when they go to California, as they do, it is decidedly dangerous.

Q. Is the orange worm affected by the climate—that is, does a colder climate than the Mexican climate have any effect on it?—A. I think it will thrive wherever oranges grow.

Q. What have you to say in regard to the present condition of what is known as the cotton-boll weevil?—A. That is an insect that is alarming Texas cotton growers very much. It has spread now until it has got into some of the best cotton land in Texas; but we are not quite sure yet, whether it will spread north of the region of early heavy frosts or not. Under the present bill a small sum is appropriated for an investigation of that insect from my office. The State of Texas has appointed a State entomologist to investigate it the present year. I have the manuscript of his report at the present time. It is a Mexican insect which for a long time inhabited the low tip of Texas around Brownsville, and later was carried north to Alice and San Diego. In that region they have no heavy frosts at all and some of the cotton grows through the winter. You will find large volunteer stalks of cotton all green in the early spring; and those volunteer stalks are cultivated by people down there because the Board of Trade in Galveston offers a largesum of money for the first bale of cotton. Now, that is just the thing needed to perpetuate this weevil, and it is spreading gradually up north. When it reached San Antonio, I happened to be down there at the time of the first winter freeze, which happened about the 1st of December. I found that the insect was killed out absolutely by that frost—a frost of 21° Fahrenheit. For that reason I felt relieved and felt pretty sure that the insect would not spread farther north in the cotton and spread to other States. Recently, developments seem to show that it migrates every year from farther south, north of frost lines, and perhaps it manages then to exist in small numbers through the winter so as to start an increasing series of generations in the spring, and it may become much more serious than at first anticipated. At all events it is damaging some of the best cotton-growing regions in Texas now.

Q. Is that the only insect which the cotton grower has to contend with?—A. He has the old cotton caterpillar or army worm which feeds on the leaves of the cotton plant, but he has a very good remedy for that now. He uses paris green in a very simple way. He takes a bag of coarse cloth, fills it with pure paris green and puts it on one end of a pole and another bag on the other end of the pole. Then he puts a negro on a mule and he trots down the rows, and the jarring of the mule sifts this paris green down on the leaves, putting just enough on the cotton. It makes a very simple, inexpensive, and efficacious way of poisoning the crop. The cotton-boll worm is a very serious evil in some parts of the South, and they get rid of that by diversified crops and by using corn and cowpeas as trap crops.

Q. Will you briefly state what insects the tobacco raiser has to contend with in raising and growing his crop?—A. He has the big horn worm, as they call it, a very large green caterpillar with a horn on the end of his abdomen, and then they have a little beetle which eats holes in the leaves, and this same boll worm of the cotton also attacks tobacco; and there is a new enemy which just became known a year or so ago, which they call the split worm, an extremely small caterpillar, which mines between the upper and the lower surface of the leaf. They get rid of all the leaf-feeding caterpillars now by spraying with paris green. It sounds a little bit dangerous, but experiments have shown that paris green does not stay on the leaf. The idea is now being adopted that it is desirable to allow a certain number of solanaceous weeds to grow, belonging to the same family with the tobacco plant, and these weeds come up, if they are allowed to grow there, before the tobacco comes up, and all the tobacco insects concentrate on these weeds and are easily destroyed. That is what we call using weeds as a trap crop, just as with the

Hessian fly sometimes an early strip of wheat is sowed so as to allow the Hessian flies to concentrate, and the bulk of the wheat is planted later.

Q. Is poison ever put into the bloom of the jimson weed?—A. Yes; that is to catch the moth which lays the egg. They put a little fly poison in the bloom and the moths come along and inserting their beaks for nectar, are killed in that way. That is done in some parts of Louisiana.

Q. What remedy has been found to relieve the loss sustained from what is known as the Hessian fly?—A. I think the remedy which I have just mentioned, together with the study—a study must be made of each individual locality—of the weather conditions and the probability of early or late falls. The trap strip, I think, is the best thing to be found yet, and several of the State entomologists are working on the trap crop at this time. Stimulated by the losses from the Hessian fly last year, the Michigan men and the Ohio men and the Indiana men are working on that problem. One of my men is working on it, devoting his entire time to the Hessian-fly problem, and hopes to publish a bulletin giving the results of his investigations. No extermination of the Hessian fly is to be expected. There must be in bad years some alteration in the method of cropping. A very important point in economic entomology is the study of the crop conditions and the possibility of variation in the method of cropping. There is an insect which they call the clover-seed midge which does great damage to the clover crop. You know we cut clover in most of the Northern States twice, once for hay and once for seed. Now, this insect has two generations, and we find that the adults of the first generation issue just about the time when it is the custom to cut the first crop for hay, so that they are able to lay their eggs and destroy the seed crop when it comes up. Now, if we advance the time of cutting for hay a week or two, we absolutely destroy the insect which causes the damage. This is the custom in Ohio now very generally—they have changed the time of cutting the crop.

Q. Is the wheat weevil an insect which comes from the condition of the grain?—A. Not at all.

Q. Please state whether or not the insect has been studied and whether any remedy can be suggested for the protection of wheat in the bin?—A. The insect has been studied very carefully indeed. That is another of the European insects. In fact all the insects that are injurious to stored grain are cosmopolitan, because grain goes everywhere all over the world. In fact, there are several species of grain weevils. The one known as the fly weevil in this country is not strictly a weevil at all. It is a little moth which lays its eggs in the grain. Now, where grain is stored in bulk we find there is a very satisfactory remedy in the evaporation of bisulphide of carbon on the top of the grain. If it is put in open vessels on the top of a mass of grain in a comparatively open bin in a very tightly closed room, it evaporates rapidly and the vapor is heavier than the air and sinks down to the bottom and destroys the insects. They are now adopting hydrocyanic acid gas against a new grain moth which is becoming prevalent in this country and is known as the Mediterranean flour moth. The building is closed and the cracks all stopped up, and then by the action of sulphuric acid on cyanide of potassium this gas is liberated. The same remedy is used against the cigarette weevil which does great damage to tobacco. In a large tobacco warehouse in Baltimore only this last fall it was found that hundreds of cases of tobacco were affected by this weevil. The tops of the cases were all taken off and the building was fumigated with this gas under police inspection because it is extremely poisonous. The police were stationed on the outside near by to keep the people away, and in the morning the building was opened and it was found that not only had the weevils been killed, but also the mice and rats which infested the building.

Q. There is another insect besides the weevil, known as the chinch bug, which I suppose your department has investigated?—A. We have published a bulletin on that subject which was prepared by the Ohio entomologist, Professor Webster. It is a difficult insect to get rid of. Almost the only thing we can do is to attack it when it migrates. It migrates en masse from the wheat fields to the neighboring corn fields, along about the 1st of July. A great deal of interesting experimental work has been done in Kansas with the diseases of the chinch bug. Fungus diseases were propagated in the laboratory, and it was found that under certain conditions when these laboratory cultures were put out into the fields the disease was communicated to the healthy bugs and they died in great numbers. That is not of much practical importance because it has to be done under certain weather conditions. It had to be done in very damp weather, and the bugs became diseased after the introduction of the laboratory cultures. We are, however, experimenting with a fungus disease brought up from South Africa which is used down there against migratory grasshoppers. Cultures of it were imported last year, and in one locality in Colorado and one in Mississippi it was found that it was readily communicated to healthy grasshoppers and they died in great numbers.

Q. (By Mr. KENNEDY.) Is there danger that if the progress of the vegetable-destroying insects is not stayed by science, the fruit and vegetable foods of the world will be destroyed?—A. It will have to be stayed by practical work as well as by science.

Q. Well, I mean both.—A. By the application of remedies which are the result of scientific study. I do not know. There is a certain balance in nature which has always been preserved, and in a state of nature each species seems to take care of itself pretty well. But our whole difficulty seems to be that man by his extensive cropping has disturbed this balance of nature and in a philosophical way you may say that this enormous multiplication of injurious insects is the effort of nature to restore the original balance. That seems to be the great law as far as I can see.

Q. I would like to ask you then what knowledge you have of these pests in ancient times, if you have any? Were people bothered with them then as they are now?—A. If you will read the Prophet Joel in the Bible, you will find that he was a man who might be called an agricultural pessimist, a man who lamented a great many things. He had something to say about several insects. He is the man who said that the grasshopper had become a burden in the land, and he talked about the palmer worm; and there is no question that injurious insects were noticed as soon as man began to grow crops. As agriculture has become more extensive, the insects have found conditions more favorable for rapid multiplication. Our methods of cultivating crops in enormous fields are particularly favorable to the increase of insects. In Europe, where the agricultural holdings are smaller, where the farms are small and agriculture more intensive, they do not begin to have the same trouble as we have in this country. In the older methods of agriculture in the South, in cotton fields of from 500 to 1,000 acres, the caterpillar and boll worm were extremely injurious, and the planters could not spray with ease. Now, with much smaller fields and a more diversified system of crops, the conditions for multiplication are not nearly so good.

Q. (By Mr. KENNEDY.) Thirty years ago we used to have an invasion of the grasshoppers in Kansas so they would block railroad trains and destroy all vegetation. What is the cause of the disappearance of these grasshoppers for so long a period?—A. Very largely the settling of a great portion of the arid country which was the permanent breeding ground of the grasshoppers. It was a migratory grasshopper; it bred up in the foothills of the Rocky Mountains in arid places, and when it had devoured the vegetation near those places, and had multiplied so excessively that there was no longer anything to feed upon, it migrated to the fertile portions of Kansas and Colorado; but they have brought the conditions of cultivation into those permanent breeding grounds. But I must premise first by saying that the grasshoppers only succeeded in living one generation down in this lower country. Conditions were not favorable to their increase, and the young died. The only place they could live successfully and breed in these enormous quantities was in the permanent breeding grounds. The conditions of cultivation brought by the settling of these arid regions made these regions unfavorable for their unrestricted multiplication. That accounts for the fact that we have not had a recurrence of the Rocky Mountain locust since 1876.

Q. So that pest is practically extinct?—A. Practically so. Once in awhile a swarm will come down from the north, from the Assinaboine country, and settle in North Dakota or Minnesota, but it is stamped out promptly. A large swarm came down and settled in Ottertail County, Minn., about 7 or 8 years ago. The legislature was not in session. The governor of the State took it upon himself to authorize the purchase of several carloads of kerosene and certain destructive apparatus, and the State authorities went up there and with the aid of the county officials went to work and wiped the thing out quickly.

Q. Was that remedy crude petroleum?—A. Yes. After the eggs hatch and the young are hopping around in great masses, they drag over the ground by means of a horse a low sledge with kerosene on it, and as they go forward the hoppers jump up and light on the kerosene and are killed. Another remedy is late fall plowing. The insects hibernate in the soil and early plowing breaks up the eggs and throws them out where the birds can reach them, and so on. They have migratory grasshoppers in South America and South Africa, conditions being about the same, and they come down from the arid breeding ground to the cultivated land; and the same methods are used that are used in this country. The damage about which we hear nowadays from grasshoppers in the West is from the local nonmigratory species.

Q. (By Mr. FARQUHAR.) I would like to know something about the destruction of the foliage on shade trees in cities.—A. There are 3 or 4 species of caterpillars that defoliate shade trees all over the country, and there is the imported elm-leaf beetle. Nearly all the caterpillars, with the exception of one, are strong fliers in the adult stage; the moths are strong fliers, and the remedy of banding

the trees that we see generally adopted in cities is absolutely of no use whatever, because the adult insect flies like a bird and will alight in the top of a tree, and if the band has any effect, it will simply prevent the caterpillars from coming down and will keep them on the tree.

The elm-leaf beetle larva, however, descends to the ground to transform, and the result is that a great many of them are caught on the sticky bands of printer's ink, and so on. But the best remedy against the elm-leaf beetle is the combination of spraying the trees with some arsenical mixture and pouring hot water around the trees after the larva come down to transform.

For the caterpillars that defoliate the leaves of shade trees generally, there is no good remedy except spraying with an arsenical mixture. It should be the duty of every park commissioner of every large city to have a motor-spraying apparatus, that can be carted around the city, and spray the trees at the proper time of the year. It is a very inexpensive matter. The thing has been done by the city of New Haven in attempt to save the large elms there and it has been done in other places—in Central Park, New York, and Prospect Park, Brooklyn. It is a thing which could be done by every city, and which could be done here perfectly well, although sometimes our trees lose their entire foliage through neglect.

Q. What care is there over the trees in Washington by the municipal authorities?—A. There is a park commission appointed by the District Commissioners, who take care of the shade trees along the street; then the superintendent of public gardens and grounds has the care of the trees on the Government reservations. Now the parking commission does nothing against insects except to cut off the limbs infested with the web worm at certain times of the year and cart them away. The way they do that is to go leisurely along the street and cut off the limbs and put them on the cart; and they do it so slowly that the caterpillars can all crawl off and get on the trees again before they get to the dumps. Their work is practically worth very little.

The Superintendent of gardens and grounds sometimes sprays the trees in the parks, but he always sprays too late—after the insects have about disappeared. But even if he did spray at the proper time, it would be of very little use, because the park commission does not spray. Take the case at Lafayette Park, where you have the sidewalk here [indicating] and the trees over here; the trees on this side are sprayed and these over here are not. As soon as he sprays the trees in the park and gets rid of the insects new ones fly across 20 feet of space from the sidewalk trees and reinfest the park trees. The superintendent of public buildings and grounds has nothing to do with the street trees and is not allowed to touch them.

That same difficulty occurs in certain other cities. The trees in the parks and the trees along the streets ought to be under the control of the same man or board.

There is a great difference in the kind of shade trees from the standpoint of insect damage. The tree known as the silver maple, which is a very favorite tree with those having charge of planting shade trees, on account of its rapid growth, is one of the trees which is most badly affected by insects. It is the favorite food of 2 or 3 of the most prominent of our shade tree caterpillars. The ginkgo tree, of which we have a great many in this city and in Brooklyn, is the best shade tree from the standpoint of freedom from insect attack. The oaks are very free from insects. The Norway maple is much better than the silver maple. The box elder is one of the worst that can be planted. I could talk much more on this topic if you wished me to, but I do not suppose it is necessary.

Q. You would say it is possible with care and the expenditure of a little money in a city like Washington, to exterminate these insects?—A. To keep them in check.

Q. Keep them in check and ultimately suppress them entirely?—A. Yes.

Q. In many of the Northern cities is it some seasonal conditions that bring these pests on the trees? Is it the dampness or anything of that kind, or a dry season, that induces the amount of caterpillars to be raised?—A. Yes; the character of the season has a great deal to do with it. In dry seasons the caterpillars are apt to be rather less injurious than they are in damp seasons. Now the reason of that is a curious one. These insects are held in check under favorable conditions by certain parasitic insects—little gauzy winged insects. In damp weather these things can not fly; their wings become clogged by dampness; but in dry weather they attack the caterpillars, lay their eggs on them, and the caterpillars are destroyed. Three years ago 98 per cent of the caterpillars on our shade trees were destroyed by these parasitic flies. It was during a dry season.

Q. To check them or partially exterminate them, it is not a very expensive matter for a Government like this to take hold of?—A. Comparatively inexpensive. The park commission has an appropriation of about \$16,000 a year, I think, and that is almost entirely expended in the planting of new shade trees, and an insig.

nificant portion of it in the care of the old trees, and that insignificant portion is not wisely expended; and that is the case in almost every city that I know of.

Q. The administrative remedy in the matter would be for the cities to demand of the commissioners the proper care of the shade trees?—A. Yes; that is true.

Q. And you would say there are plenty of remedies cheaply applied that could correct these losses?—A. Yes; if applied on a large scale. The householder can not be expected to take care of the shade trees in front of his house.

Q. (By Mr. A. L. HARRIS.) Have you discovered any insects that prey on some of the insects that you have mentioned that are injurious to fruits and grain?—A. Oh, yes; nearly every injurious insect has a certain number of parasites, but the practical encouragement of these parasites is a very complicated thing and generally impracticable. In the case of some of our imported insects, we have done good work by importing their natural enemies from the country of their origin. That was the case with the so-called white scale of California, an insect which threatened the extinction of the citrus-fruit industry in California. We discovered this insect was originally from Australia, and through correspondence we found it was not a very abundant insect, although it multiplied most extraordinarily in California and killed out whole orchards. The inference was that it had some parasitic insect in Australia that kept it in check. We sent out there and found the insect and imported it into California, and it bred so rapidly that inside of a single year the white scale was practically wiped out of existence.

Now, we have passed that insect around. We have sent him over to Portugal, where the same insect was wiping out the orange industry on the banks of the river Tagus. We sent it to Egypt, where the same insect was in the gardens of Cairo and Alexandria; and it was equally efficacious there. That is the most strikingly successful incident of that kind of work that we have done, but we have done others that have been efficacious. For example, there were brought over from Australia some little beetles that preyed on the so-called black scale of the olive, and which have proved very efficacious in certain portions of California in killing off this scale. In certain other portions they have not bred so rapidly. This last year we brought over a parasite from South Africa for this same black scale on the olive, which we think will take the place of the other in the drier portions where the other is not so effective.

We brought over a number of years ago a parasite for the common imported cabbage worm, which in certain parts of the country has multiplied and is doing good work. We imported some years ago a parasite of the Hessian fly, which took hold for a while in one point in Maryland, but it has disappeared.

Q. (By Mr. FARQUHAR.) What help do the birds give you?—A. Birds are very important indeed; and it is so well an understood fact that it would be almost trite to say the shooting of birds is increasing the chances for the multiplication of injurious insects. There are a great many interesting facts on record as to the amount of insect food which our insectivorous birds eat in the course of a month. A good many of the publications of one branch of our Department are on that subject—Dr. Merriam's division. A very extensive series of examinations of the stomach contents of birds show what birds are injurious and what are beneficial.

Q. You might name some of those if you have them in mind?—A. That is hardly my work, and I am afraid I could not.

Q. Would the sparrow be included?—A. The English sparrow is an unmitigated pest from every standpoint.

Q. Is it insectivorous?—A. It will eat insects when it can not get anything else. Because it eats insects, a bird is not necessarily a beneficial bird. It may have a predilection for beneficial insects. There are probably almost as many insects that are parasitic, or that prey on injurious insects, as there are injurious insects; but unfortunately the injurious kinds seem to multiply more rapidly and to be more prolific.

Q. You spoke of the possibility of a famine that might come to the world through these insects destroying the production?—A. That was Mr. Kennedy's suggestion.

Q. Haven't you to take into account the cooperation of men with nature in the multiplying of all these products over and above the natural production?—A. Of course.

Q. Man's cooperation is likely to overcome a destructive feature of that kind?—A. I think so.

Q. (By Mr. A. L. HARRIS.) To what extent is your bureau assisted by the States in the work you are doing?—A. We assist one another; we do a certain amount of cooperative work. For example, there happens to be in West Virginia a man who has paid special attention to the insects injurious to forest trees—Dr. A. D. Hopkins. He has devoted his entire time to that subject. A year ago last Spring I employed Dr. Hopkins to take a trip to Washington, Oregon, and Idaho to study damage done by insects to the forests in that part of the country.

Last year I sent him to Maine to study damage done to spruce forests. I have not a man on the force who has the same specialized knowledge as Dr. Hopkins. His State is largely a forest State, and the experience which he gains on these trips, undertaken at the expense of the Department of Agriculture, is of value to him, and his experience is of value to us. In the same way we have employed the assistance of certain other State officials. This is important when it comes to the broad question of the insects which extend all over the country. We have an association of all these entomologists. The work is divided up, and each man studies conditions in his locality. These conditions are all brought together, and we thus have a summary and survey we could not get in any other way.

Q. (By Mr. FARQUHAR.) Are there other departments in the Department of Agriculture that cooperate with your bureau?—A. In a way. For example, the subject of the chemical constituents of chemical insecticides; the amount of adulteration that is being done in insecticides—it is almost impossible to get a pure paris green. Dr. Wiley is analyzing a large quantity of these things for us. In the same way other divisions would be constantly treading on each other's toes without a certain amount of cooperation. For example, Mr. Wood's division is studying the diseases of plants. Here we find that insects are responsible for the spread of certain diseases among plants, as with human beings. There is a wilt of the melon leaf, a bacterial disease which causes the leaves of the melon to wilt. It is found this disease is carried by insects. A beetle comes along and gnaws a hole in the leaf. The hole is insignificant, but it introduces the bacteria which causes the disease. In that way the different divisions cooperate. Also, the Bureau of Animal Industry takes the whole question of live stock, and of course there are many insects which are injurious to animals—the horse bot, ox warble or grub, and the sheep bot, and so on.

Q. (By Mr. A. L. HARRIS.) How many of the States have established a bureau of entomology?—A. There are 30 States now which employ an official entomologist under the agricultural experiment stations.

Q. Can you speak as to the thoroughness of their investigations from the contact that you have had with them?—A. Their relative thoroughness?

Q. Yes.—A. I should hardly like to go on record in that regard; they are nearly all personal friends of mine.

Q. I did not know but what you had a word of praise for them.—A. Some of them are doing excellent work. You see, this experiment-station movement is a comparatively recent one. The entomologists had no collections; no libraries; nothing but individual experience. There was a sudden demand for a class that did not exist. Most of them were young men just out of college, and they had no libraries or collections, and they had, moreover, to educate the farmers of the State. They had to go around and talk at farmers' conventions, and had to publish bulletins which were simply compilations of what had been learned by others; and it is only recently that some few of them have got into the position where, by collections and libraries and apparatus, they have been able to get down to original investigation. The State of Ohio stands near the top. The State of New York has a very efficient service; the State of Illinois also, and a number of the others.

Q. The interest is growing, I suppose?—A. Very largely—growing enormously. In my early experience in appearing before farmers' conventions the farmers listened to me with, I will not say incredulity, but certainly with indifference. They looked upon any man who talked about the application of science to agriculture as a theoretical fellow who had not the practical experience which was necessary before practical ideas could be gained. The results which have been achieved, not only by my branch of the work but by other branches of the Department of Agriculture, have been so great that the farmers have changed their attitude entirely. One of us goes out and he finds that he is listened to with respect; and not only that, but he is kept on his feet to answer questions for an hour after he gets through with his talk; and the State agricultural experiment station men say the same thing. There is a very rapidly growing appreciation by the farmer in regard to the work of science as applied to agriculture.

Q. How is this knowledge distributed to the people, in bulletins?—A. In bulletins and in circulars and in larger reports.

Q. You have a mailing list, have you?—A. Yes. Owing to recent Congressional legislation, however, there is only one class of bulletins of our Department which can be freely distributed to every applicant. These are the so-called Farmers' Bulletins. We have a series of about 150 of them. But the circulars, of which we have published 40 or 50 in our branch of the work, and which are concise directions about specific insects, these are used in our correspondence, and they answer the purpose perfectly well. In the larger bulletins we have a restricted mailing list, but they can be purchased from the superintendent of documents for about 5

cents or 10 cents each. In the several experiment stations in the States the bulletins are published in large editions of 20,000 copies and distributed very widely.

Q. You have the advantage of free mailing facilities?—A. Yes.

Q. What is the condition in regard to the States in issuing their bulletins?—A. They are issued under frank also.

Q. (By Mr. KENNEDY.) Under frank of what, your Department?—A. It seems to me there has been some special legislation.

Q. (By Mr. A. L. HARRIS.) Have you any suggestions to make as to future legislation, that would strengthen your bureau, by the National Government? Of course you act through the Department of Agriculture, but have you any suggestions to make wherein you feel that your work could be made more efficient?—A. My own work?

Q. Yes; your bureau first.—A. Nothing, except larger appropriations. I imagine we can spend a good deal more money than we are getting to the advantage of the agricultural classes—I feel sure. We had a lump fund of \$22,500 last year; about 75 per cent of that was expended in salaries of investigators who could be put on anything that happened to come up. We investigated a good many particular topics; for instance, insects attacking garden crops, and generally speaking, insects attacking citrus crops, and the general subject of beneficial insects from abroad, and a number of other topics of that kind. We could do the work more expeditiously, perhaps—not more thoroughly, but more expeditiously—with larger means. I do not wish here to mention a specific sum.

Q. (By Mr. KENNEDY.) Congress is not as liberal with your bureau as with Dr. Salmon's?—A. By no means.

Q. He said they gave him all the money he could expend.—A. His is a bureau; mine is a so-called division.

Q. (By Mr. A. L. HARRIS.) The importance of your bureau is growing, I suppose, from year to year, as manifested by the size of your appropriation?—A. That would indicate not so much the growing importance of the bureau as a growing appreciation of its importance. I do not think its importance is growing, but the appreciation of its importance is growing. When I first came to Washington the only appropriation was for the salary of the entomologist and one assistant; now they give not only the lump sum I mentioned, but also about \$10,000 more in statutory salaries, so called.

Q. (By Mr. KENNEDY.) Do you have much assistance in your work from the agricultural press of the country?—A. The agricultural press have done a great deal of good in this line of work; yes. Certain of them have started entomological investigations in the way of soliciting information from certain parts of the country on certain aspects. The information they have gathered has been largely statistical.

Q. Also, they assist you in disseminating.—A. (Interrupting.) They disseminate our results very rapidly. They are anxious to get hold of anything in the way of results. The agricultural newspapers are especially good in one way—they send their newspapers to most of the working officials of the Department without charge. For instance, in my own office 75 or 80 come in every week, and we clip the insect portions and keep a general oversight in that way of everything going on in the local agricultural societies and so on that bears on our work. Before we finish, I want to say a word or two more on the subject of State legislation.

Q. (By Mr. A. L. HARRIS.) That is what we would like to have.—A. Out of the 45 States only 21 have inspection laws or laws which enable them to do any organized work against insects. As I said before, those States which have no law are constantly in danger, not only of the San Jose scale, but other insects which they do not have at all. This bill now before Congress would act as a quarantine bill against injurious insects from abroad, and it would also act in the regulation of interstate traffic in nursery stock and things of that kind—living plants of any kind—leaving, then, for the States simply the question of the extermination of the insects within their own borders. Either that national bill must pass, leaving the question of inspection of plants intended for interstate commerce to the General Government, or the States must pass uniform laws. It is very confusing now, even with the 21 that have laws, since one form of certificate is required by one State and another by another, and it is necessary for a nurseryman dealing in plants at the present time to have before him in condensed form 21 sets of laws and forms of inspection and consult them in about every shipment of stock that he makes. I think that would be a good point to bring out in your report, if you agree with me. There should be some uniformity in State laws.

Q. Under the police regulations, I suppose the States could prevent the entrance into the State of foreign nursery stock unless it was properly certified to?—A. Yes, that could be done.

Q. And the State could not be required to wait for the Federal Government under the interstate commerce provision of the Constitution before they could put that on their own statute books?—A. That is true; the State of California protects herself admirably in just that way at the present time.

Q. Have any of the States attempted anything along that line?—A. Yes; as I say, California has done it; Oregon has done it; the Maryland State law has something of that bearing, although not as explicit as it should be. The new New York State law is a very curious one. Up to this last session—I do not know what measures they passed then—but up to this last session it prevented the sending of infected nursery stock outside of the State, but it did not prevent the admission of infected nursery stock from other States—a very curious anomaly. California, for example, whose law has been the longest in effect, prevents the admission of anything but does not prevent the sending out of anything. A man who exhibits for sale in the market in Los Angeles a tray of apples infected by the San Jose scale is arrested and fined; but if he puts a top on that tray and ships it to Chicago it is all right.

Q. Which State, in your opinion, has the best law?—A. It is a subject upon which I would not like to express an opinion at the present moment, because the regulations of the New York State law and the Illinois law have not been tried sufficiently. In the course of a few years of use we will be able to say which is the ideal law, and it will be easy for those which have laws to modify them in accordance with that experience, and for those States which have no laws to adopt the one found to be best. The Illinois law seems to work very well indeed. The Maryland people are rather well pleased with their law, although some of the nurserymen in outside States object to the stringency of the Maryland law. It is my opinion that Maryland is very well protected by her law.

Q. You would advise uniform legislation on the subject as nearly as possible?—A. Yes; either in the shape of a national law or the unification of State laws.

Q. To what extent are the State legislatures supporting the bureaus of entomology in the way of appropriations?—A. In the different States?

Q. In the different States; is it sufficient?—A. They are supporting it in some States and in others they are not. Very few States are making specific appropriations for insects, but many of the States give to the experiment stations in addition to funds given by the General Government. That fund appropriated by the State is distributed among the different branches of the work by the director of the station or by the board of control. There is, however, in the State of Illinois a State entomologist, who is supported by State appropriations; there is also in New York; the same thing has recently been done in Texas.

Q. If more liberal appropriations could have been made the work could have been done more efficiently?—A. I think so; yes.

Q. You think the work is of sufficient importance for the legislatures to take an interest in the matter in the way of protection?—A. I think so, decidedly. Conditions vary in different States. We have so many different kinds of climate in the United States that an insect might be locally of enormous importance in one section of the country and comparatively of no importance in the rest of the country. Take the cotton boll weevil in the State of Texas, for example. Now, in these cases, don't you think the State ought to do the work rather than the General Government? It seems so to me, except in cases where a spread of the insect over large territory comprising a number of States is reasonably to be expected. The argument made in the case of the gipsy moth was that it would spread to other States in case the Massachusetts people did not handle it by themselves. But there are insects which are restricted climatically to certain portions. In southern California there are some insects which are peculiar to that part of the country, for instance.

Q. I would like to know by what means the gipsy moth spreads.—A. It spreads only by the traveling of the caterpillar and by the carriage of the caterpillar by wagons and other vehicles which it may crawl upon. It spins down from trees to a limited extent, and persons walking through the region get the caterpillars upon them and carry them, and getting on a trolley car, perhaps, may carry them a good many miles in that way. They may drop on carriages or crawl on railroad cars that are side tracked and be carried hundreds of miles in that way.

Q. No State is then protected at the present time?—A. No. If the State of Massachusetts does not take up the work I confidently expect the gipsy moth will be found in a few years in New Hampshire, Connecticut, Rhode Island, and New York.

Q. (By Mr. A. L. HARRIS.) Your bureau is a very important one, and it is one of growing interest, and you seem to have some notes there; if there is anything that we have omitted that is important, I wish you would on your own

motion state it.—A. I merely brought along, not in the way of notes, some data and facts, most of which I have just given you.

This quotation is taken from the memorial prepared by a committee of the American Association of Nurserymen to Congress, praying for the passage of the bill I mentioned, and a copy of which I will submit: [Reading.]

"The chief danger to the nursery interests of the country is that the different States have passed diverse laws, many of them very drastic in character, practically prohibitory, so that an honest nurseryman is unable to send clean nursery stock into many of the States, while a dishonest man, or a careless one, may freely send infested stock to other States which have not yet protected themselves by State laws. These difficulties can only be reached by a law governing interstate commerce, such as is now proposed. Moreover, aside from the actual damage which the insect (the San Jose scale) has done in nurseries, the fact becoming known that a nursery has become infested with the scale has, in many cases, operated so severely as to entirely destroy the reputation and credit of the firm. From what has just been said the necessity for a uniform national law becomes apparent. The different requirements of State laws, and the entire lack of any law in certain States, has produced a condition intolerable to the nurserymen and of great danger to the orchardist. For example, a man shipping trees into Maryland requires one form of certificate: shipping into Virginia he requires yet another form under present regulations; while into other States, as Ohio, no form of certificate is required, thus making it the dumping ground for infested stock from all districts. Moreover, in New York the law prohibits sending infested stock outside the State, but does not prohibit its entrance. Such incongruities as these in State laws indicate most strongly the necessity for a uniform national law.

The bill above mentioned was favorably reported, with amendments, by the Committee on Agriculture of the House of Representatives. The following is an extract from that report: (Reading)

* * * * *

"The necessity of such legislation is of grave importance for the protection of our agricultural and horticultural interests. Scientific men and nurserymen have recommended it for years, and the demand for it upon the part of the people has become so strong that it should be deferred no longer. The pending bill has been indorsed by representatives of entomologists and vegetable pathologists, as well as by nurserymen and fruit growers. The committee is not advised of any opposition to this bill from any quarter.

"It is an acknowledged fact that fully one-half of the principal injurious insects now in the United States have been introduced from foreign countries. No effort on the part of the General Government has ever been made to prohibit the entrance of such pests.

"The State of California has alone established a horticultural quarantine at the port of San Francisco, but this is the only one of our great ports which is so protected. At San Francisco during the past year 123 steamships and sailing vessels arrived carrying trees, plants, and fruits from Japan, Ceylon, Australia, New Zealand, South Sea Islands, Central America, Mexico, and British Columbia. The quarantine officer destroyed over 3,000 trees and plants infested with insects new to California. Other stock was thoroughly fumigated with hydrocyanic acid gas.

"The estimated annual damage to agricultural and horticultural interests of this country from the attacks of injurious insects amounts to \$300,000,000; and it is safe to say that, at a low estimate, at least one-half of this damage is done by imported insects.

"As indicated in a later paragraph, a number of foreign countries have quarantined against American plants and fruits, but no such quarantine exists in this country, although the necessity of it, from the facts just mentioned, is obvious.

"There exist in Europe, especially in south Europe, and in the countries beyond the Pacific, with which we are just entering into greatly enlarged commercial relations, many insects noted as pests which are liable at any time to make their appearance in this country under existing conditions.

"It has been so general an experience as to make it practically a hard-and-fast rule that foreign insects introduced into this country thrive in a much greater degree than in their native homes.

"From the West Indies and from Mexico we are also in danger. For example, there exists in Mexico a maggot which infests oranges and lemons, known as Morelos fruit worm, which has not yet become established in this country. It occurs in all parts of Mexico and Central America, except possibly the State of Sonora in Mexico, and Mexican oranges for the United States have come across our borders

and taken their place in our markets during the months of November and December. Most of these oranges have previously been shipped to Northern markets where there is no danger of an orange pest establishing itself. Of late, however, they have been carried into California, and the extensive citrus industry of that State is in danger. Within the past 2 months a cargo of Mexican oranges, riddled with this maggot, was stopped at the port of San Francisco, and the oranges were burned under the operation of the State quarantine law.

"Louisiana and Florida are not protected in the same way, however, and the danger is a real one. Even in the case of the Mexican oranges shipped to the Northern and Middle States, the empty cars are frequently carried back to California, and perhaps to other orange-growing regions, and thus becoming an additional source of danger.

"The success of the State quarantine at the port of San Francisco indicates what may be done and what should be done at other ports of entry of the country by national legislation. It should be said, however, that while the quarantine at San Francisco protects California, it does not protect the rest of the country because the State officers have jurisdiction over shipments intended for California.

"It is safe to say that had such a quarantine service been in operation at all the principal ports of the United States during the past 30 years, the cost of its operation would have compared with the actual saving to the agricultural and horticultural interests of this country as one to one hundred; and it is equally safe to say that such a service in the future would result with equal, and probably, on account of the increased foreign trade, with greater relative benefit to this country.

"A seriously destructive insect known as the San Jose scale, introduced a number of years ago into California, possibly from Japan, has been and is being scattered over our country in interstate commerce.

"This scale is the worst insect enemy to orchard trees which this country has ever known. Since its accidental introduction into the Eastern States, it has spread or has been carried into almost every State in which the orchard industry is a feature. It has done its greatest damage in the States of Maryland, Virginia, New Jersey, Ohio, Georgia, Indiana, and Illinois. It also occurs in Canada, and has been the cause of an absolute prohibition against the introduction of American trees and plants on the part of Canada, Germany, Austria-Hungary, France, Switzerland, Turkey, and Cape Colony, and of fruits as well on the part of Germany.

"The worst aspect of this danger is that the insect itself is so extremely minute that it is carried in shipments of trees and plants, and obtains a foothold in many places, and entirely escapes the attention of the uninstructed eye until after it may have done irreparable damage and become thoroughly established and escaped from this as a center of destruction to the regions around about.

"In spite of its minute size, it multiplies with such rapidity as to cover the bark of young trees and sap their vitality to such an extent that the trees are killed in the course of 2 or 3 years.

"For example, in Maryland a peach orchard of 20,000 trees was completely destroyed in 2 years.

"An outbreak occurred on Catawba Island, Ohio, which necessitated the destruction of over 3,000 bearing peach trees and the expensive treatment of an additional area of 1,000 acres.

"The peach and plum interests of Georgia are very great. In one county alone the orchards are estimated to be worth over \$5,000,000. In certain portions of the State the trees have become infested by the scale to such an extent that within the past few weeks one orchard of 3,000 trees has been condemned and the trees burned. In another orchard 1,000 trees have been condemned and burned the present winter. Thus the orchard interests of this State are threatened, perhaps, with extinction.

"In North Carolina a valuable orchard of 80,000 large peach trees was cut down and the trees were burned the past autumn.

"Instances similar to these might be multiplied.

"The danger from this insect is greater in this country than in any other country on account of the custom among nurserymen and orchardists of very extended interstate commerce. Nursery stock is bought in small and large quantities in different States, and is shipped by freight, express, or by mail to other States, thus spreading the infestation.

* * * * *

"In the opinion of the committee this bill is a step in the right direction, and is worthy of early and favorable consideration."

(The following is a copy of the bill (as amended) submitted and referred to above by the witness:

[H. R. 96, Fifty-sixth Congress, first session. Report No. 304.]

IN THE HOUSE OF REPRESENTATIVES.

DECEMBER 4, 1899.—Mr. Wadsworth introduced the following bill; which was referred to the Committee on Agriculture and ordered to be printed.

FEBRUARY 12, 1900.—Reported with amendments, committed to the Committee of the Whole House on the state of the Union, and ordered to be printed.

A BILL to provide rules and regulations governing the importation of trees, plants, shrubs, vines, grafts, cuttings, and buds, commonly known as nursery stock, and fruits into the United States, and rules and regulations for the inspection of trees, plants, shrubs, vines, grafts, cuttings, and buds, commonly known as nursery stock, grown within the United States, which become subjects of interstate commerce or exportation.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That it shall be unlawful for any transportation company, after July first, nineteen hundred, to offer for entry at any port in the United States any trees, plants, shrubs, vines, grafts, cuttings, and buds, commonly known as nursery stock, unless accompanied by a certificate of inspection by an official expert of the country from which the exportation was made, which certificate shall be made in the manner and form prescribed by the Secretary of Agriculture, certifying that the contents have been examined and found apparently free from all insect and fungous or other diseases dangerously injurious to nursery stock. In case any nursery goods are offered for entry without said certificate, it shall be the duty of the collector immediately to notify the Secretary of Agriculture, who shall arrange for inspection, to be made at the expense of the importer, who shall pay therefor a fee to be fixed by the Secretary of Agriculture, and said collector shall not allow them to pass within the jurisdiction of the United States until proper certificate of inspection has been received. And after the aforesaid date, July first, nineteen hundred, all nursery stock imported in accordance with the aforesaid regulations shall be free from all further inspection, quarantine, or restrictions in interstate commerce: *Provided, however,* That nothing herein contained shall prevent the inspection of such nursery stock by the authorized inspectors of any State or Territory at the final point of destination in accordance with the laws of said State or Territory; but the Secretary of Agriculture may at any time relieve such articles from inspection by a specific order. All trees, plants, shrubs, vines, grafts, cuttings, and buds, commonly known as nursery stock, shall be subject to inspection by official experts at such ports of entry as shall from time to time be designated by the Secretary of Agriculture, with the approval of the Secretary of the Treasury, and published in the regulations provided for in this act.

SEC. 2. That whenever it shall appear to the Secretary of Agriculture that any nursery stock or variety of fruit grown in an infested district outside of the United States is being, or is about to be, imported into the United States or the District of Columbia, and such variety of fruit is infested by any seriously injurious insect or disease, and which insect or disease is liable to become established in the United States and seriously affect any such nursery stock or variety of fruit grown therein, he shall have authority to quarantine against any such importations and prevent the same until such time as it may appear to him that any such insect or disease has become exterminated in the country or district from which such fruit is being, or is about to be, imported, when he may withdraw the quarantine; and this shall operate to relieve all such nursery stock or fruit from further quarantine or restrictions so long as the conditions of freedom from seriously injurious insect or disease shall continue.

SEC. 3. That any trees, plants, shrubs, vines, and buds, commonly known as nursery stock, grown within the United States, may, upon complaint or reasonable ground on the part of the Secretary of Agriculture to believe that the same are infested with disease, become subjects of interstate commerce under the rules and regulations as hereinafter provided. The Secretary of Agriculture shall cause to be inspected by a qualified entomologist and vegetable pathologist all trees, plants, shrubs, vines, and buds, known as nursery stock, which are subjects of interstate commerce, and which are about to be transported from one State or Territory or the District of Columbia into another State or Territory or the District of Columbia. This examination shall be made, so far as possible, prior to September first

of each year, in the manner provided for and prescribed by the Secretary of Agriculture; and if such nursery stock is found to be apparently free from dangerously injurious insects or diseases, the certificate of the officer making such examination and finding shall be issued to the owner or owners of such nursery stock, a copy of which certificate shall be attached to and accompany each carload, box, bale, or package, and when so attached and accompanying shall operate to release all such nursery stock from further inspection, quarantine, or restriction in interstate commerce: *Provided, however*, That nothing herein contained shall prevent the inspection of such nursery stock by the authorized inspectors of any State or Territory at the final point of destination in accordance with the laws of said State or Territory.

SEC. 4. That it shall be unlawful for any person, persons, or corporation to deliver to any other person, persons, or corporation, or to the postal service of the United States (except for scientific purposes or by permission of the Secretary of Agriculture), for transportation from one State or Territory or the District of Columbia to any other State or Territory or the District of Columbia, or for exportation to any foreign country, any trees, plants, shrubs, vines, or other nursery stock which have not been examined in accordance with the provision of section three of this act, or which on said examination have been declared by the inspector to be infested with dangerously injurious insects or diseases. Any person, persons, firm, or corporation who shall forge, counterfeit, or knowingly alter, deface, or destroy any certificate or copy thereof as provided for in this act and in the regulations of the Secretary of Agriculture, or shall in any way violate the provisions of this act, shall be deemed guilty of a misdemeanor, and on a conviction thereof shall be punished by a fine not to exceed five hundred dollars nor less than two hundred dollars, or by imprisonment not to exceed one year, or both, at the discretion of the court.

SEC. 5. That the rules and regulations herein provided for shall be promulgated on or before the first day of July of each year.

SEC. 6. That the sum of one hundred thousand dollars, to be available on the first day of May, nineteen hundred, or so much thereof as may be necessary, is hereby appropriated, out of any moneys in the Treasury of the United States not otherwise appropriated, to carry into effect the provisions of this act.

SEC. 7. That this act shall take effect on and after the thirtieth day of June, nineteen hundred.

SEC. 8. That the provisions of this act shall not apply in interstate commerce to florists' greenhouse trees, shrubs, plants, bulbs, and commonly known as florists' stock.

This same bill, word for word, with the exception that the date when the law is to take effect is changed to July 1, 1901, was introduced in the Senate January 17, 1901, by Senator Perkins, of California, and is printed as S. 5615, Fifty-sixth Congress, second session.

As I stated, and as indicated in the texts of these bills, such part of these proposed laws as apply to interstate commerce in nursery stock, etc., are not intended to conflict with existing State laws concerning especially the enforced treatment against and attempt to eradicate injurious insects and plant diseases. In other words, when this law comes into effect it will still in many cases be necessary to supplement it by the operation of State laws. Nearly all of the State laws provide for the inspection of orchards as well as nurseries and for the enforced treatment of such as are found to be infested with dangerous insects, and especially the San Jose scale. Others wisely provide for the establishment of county or district boards of commissioners upon the complaint of a certain number of citizens that certain premises are affected by dangerously injurious insects, thus placing the State in position to handle any emergency that might arise in the future. In other words, the national bill handles only one aspect of the question as it appeals to State organizations. Even in the event of the passage of the national law, it will be necessary for most States and desirable for all to keep in operation a good crop pest law. Of such laws already in existence, that which has stood the test for the longest period of time is the California law, and it is desirable that all States should enact legislation of a very similar character. The greatest reason for uniformity in State laws on these topics, however, would be obviated by the passage of the national act. Should this national legislation fail, and even in the interim of its consideration uniformity in State legislation is highly desirable. A few of the State laws are of too recent enactment to judge of the full effect of their operation and for this reason it would be practically impossible to select any one law and announce it as a model for other States. The laws of the State of California, just referred to, have been very effective as to the handling of insect outbreaks

within the boundaries of that State. They have also been effective as to the prevention of the introduction of injurious insects, but they lack, as already pointed out, the important provision which is found in the New York State law and which prevents the shipment of infested material from within the State to points outside. The California law also has no provision which will permit the acceptance of inspection certificates from properly qualified officials of other States or countries and, in the event of the passage of a national law, the California law will need modification.

In the four years which have elapsed since the "National Convention for the Suppression of Insect Pests and Plant Diseases by Legislation" was held in Washington, a number of new laws have come into existence and very widespread experience in the operation of these laws has been gained. The subject of uniformity in State legislation, it seems to me, could very properly and authoritatively be discussed by another national convention composed, as was the first, of representatives of State horticultural and agricultural societies, of the National Association of Nurserymen, of the Association of Economic Entomologists, and of the Divisions of Entomology, Pomology, and Vegetable Pathology of the United States Department of Agriculture, with, perhaps, a representative of the office of the attorney-general of each State. It should be the duty of this convention to unite upon the details of such a uniform State law as is undoubtedly needed.

(Testimony closed.)

WASHINGTON, D. C., January 29, 1901.

TESTIMONY OF WILLIAM CARTER STUBBS, PH. D.

Director Louisiana Experiment Stations.

The commission met at 10.55 a. m., Mr. Farquhar presiding; at that time Mr. William Carter Stubbs was introduced as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Please give your name, post-office address, and official position.—A. William Carter Stubbs, Audubon Park, New Orleans; director Louisiana experiment stations.

Q. (By Mr. A. L. HARRIS.) How long have you been engaged in experiment-station work?—A. Since 1872.

Q. Where did you have your first experience?—A. In the agricultural and mechanical college of Alabama. I began there in 1872, and have been connected with agricultural colleges ever since.

Q. Are you a farmer also?—A. I am a farmer, I assume; yes. I am a planter. We call them farmers in Virginia and planters in Louisiana—in the South. I own my old homestead in Virginia, which was, if you will allow me, settled by my ancestors in 1652, and has never been out of the family.

Q. You still have an interest in farming in Virginia?—A. I still own that old homestead; there is about 900 acres in it.

Q. Have you any land interests in Alabama?—A. I have a large plantation in the northern portion of the State, on the Tennessee River, which I am running. I married in Alabama, and I lived there 16 years, and hence I have some accumulations I made during that time, and still own them.

Q. You are conversant with agricultural conditions in Alabama?—A. Yes; I have been in every county of the State of Alabama on an agricultural mission. We held farmers' institutes everywhere over the State—agricultural meetings; and further, I might say, I was State chemist at the same time for Alabama for a number of years and quite familiar with the scientific side of the agricultural question.

Q. Are you thoroughly conversant with conditions in the State of Louisiana?—A. I think I ought to be. I have been there 16 years, and I suppose I can shake hands with almost every farmer in the State and he will recognize me. I have been a very active agent for agriculture for the 16 years that I have been there.

Q. Please state, in your own way, the condition of labor in your State particularly and over the South generally, as you are acquainted?—A. In the past 10 years Louisiana has increased in agricultural products, in the area that has been cultivated, and of course there has been a natural increase in the number engaged in agricultural labor; but there is, I suppose, comparatively a decrease in numbers. I mean by that, not all the natural increase remains with us. They have

left us to go to towns, villages, cities, to go on railroads, to go on the levees. A few months ago I was in Cairo, Ill., a city like New Orleans in that it has a levee around it to protect it from the floods. I was there over a day and took a walk around on the levees, and found 2,500 colored men engaged in the work. I naturally sought to know where they came from, and found to my great surprise that a great number were from Louisiana. That will give you an idea where they are drifting. We are losing them in considerable numbers, particularly along the lines of railroad and steamboat travel.

Q. Please state the comparative condition of your labor now with former years.—A. I do not think the laborers have accumulated much. I do not think there is as much owned per capita as there was 10 years ago. I do not think they are as effective as they were 10 years ago. There is among the younger generation an indisposition to be taught. We have still a number of negroes that are, like myself, remnants of antebellum days, and while they are in great demand and sought for, yet the younger generation has never been taught or trained, and, with no disposition to learn, they are not as effective.

Q. How are their habits?—A. Their habits are bad. As all of you know who have been familiar with our newspapers, every now and then the game of craps, as they call it, is a source of disturbance and disagreement, and sometimes results in very serious trouble down there with us. There is a religious enthusiasm that prevails among our negroes—you can not call it a Christian enthusiasm, because they have their churches entirely separate from the whites and under nobody's control. That is perhaps almost universal throughout the South, but the morals of the negroes are not good—not as good as they were 10 years ago. As a proof of that I refer you to our penitentiary records. The occupants are more numerous to-day than at any time previous, and the crimes are of an entirely different order from what they used to be. Now you will find quite a large number of negroes in the penitentiary for forgery, the result of a little education. As soon as they learn to read and write they think the hoe and plow must be abandoned and they must hunt for an easier way of living, not always with success.

Q. Is that one of the causes of their leaving the plantation?—A. That is one. You know the average American is a restless individual. He has traveled from Plymouth Rock and Jamestown entirely across the continent, and is crossing the ocean now into the western isles. The negro, associating with the white man, imbibes that disposition, and as soon as he can read and write he desires to travel, too, and he takes any opportunity he can to do so. If he can go no farther than the village, he will go there; if he can take shipping on board steamer from New Orleans to St. Louis, or along the banks of the river, he will do that. He will get away somewhere. He wants to see the world, and wants to live easier. He does not like to work. I suppose it is one of the inheritances of America that the negro is just taking hold of. He is not as steady as he was. There are not the local attractions there used to be, and he is not satisfied, as formerly, with his work.

Q. Has improved machinery any effect upon your labor?—A. I would like to premise a little by stating here that Louisiana is peculiarly unique in its agricultural products. The southern portion of our State is devoted exclusively, I might almost use the term, to the growing of subtropical crops. Commencing at the Lower Mississippi we grow oranges very largely; then the sugar plantations begin; then the rice fields are interspersed among the canefields, and extend across the State southwesterly into Texas. Beyond this sugar and rice country commence the cotton, and corn, and stock. Now, when we get into the cotton country there has been very little improved machinery introduced, for reasons which I will explain presently. When we get into the cane and rice country we are up-to-date with anyone, I suppose. The lower portion of Louisiana to-day is, perhaps, more intelligently cultivated, and there is more economy in methods, than is any other portion of the world. This is due to the fact that in south Louisiana all our estates are run with hired labor, by the day, under intelligent supervision of managers, overseers, etc. Our sugar interests have had to bring to their aid every single implement and every single method or process that can best economize the production of sugar and rice, and they have done so. The negroes are taught to use these improvements by the supervising overseer or manager that accompanies them to the field and remains with them all day long and comes out with them at night. They work entirely under the eye or supervision of the manager. You will go into a field and find a hundred 2-horse plows or cultivators with a man on horseback riding from one to the other all day long pushing and seeing that the work is done properly. These estates are under experienced, educated managers and overseers, and their methods of cultivation have improved enormously in the last 15 years. Cultivators—everything that can minimize labor—are now used

where formerly we used the plow and hoe. The hoe is largely dispensed with to-day by the use of the improved cultivator. These laborers living on the place are given house rent free—a house and garden patch and all the fuel that is needed. The only condition of their occupying these houses is that they are to work whenever called upon, and they are usually called upon all the time. When they refuse to work they have to vacate the house, and that is the chief stimulus to make them work. In the southern portion of the State they have no other place to go. There are no houses for rent off the plantations, and hence they have to remain on some plantation, and if they do so remain they have to work, of course, because the houses are for the operatives of the estates.

Q. (By Mr. A. L. HARRIS.) Does sugar plantation machinery stop with the cultivation?—A. Oh, no; we have \$100,000,000 invested in sugarhouses, and these sugarhouses are up to date in every respect. I speak advisedly, because during last summer I had the pleasure of an official visit in the Hawaiian Islands; and Hawaii to-day is leading the world in the production of sugar. We have a large number of sugarhouses fully equal to any in the world, and those sugarhouses have been reconstructed, I might say, at the entire cost of all the profit made since the war. I believe every dollar made in the sugar industry in Louisiana has gone into the reconstruction of these sugarhouses, and they have been reconstructed with the object of increasing the capacity and diminishing the expense. To illustrate: When I went to Louisiana 16 years ago a sugarhouse that had a capacity of 200 tons of cane a day was considered a marvel of excellence; to-day we have several of them that are taking up from 1,500 to 2,000 tons a day. It formerly required 40 or 50 hands to put the cane on the carrier. The wagon would drive to the cane yard and drop its load, and then that cane was transferred by hand labor to the carrier, about 40 to 50 hands being required to keep the carrier going and feed a mill whose capacity was 200 tons a day; to-day we have improved machinery that lifts up the whole wagonload and puts it in cars that are run alongside the carrier. The sides of the cars are lowered, and a machine very much like an inverted hay loader puts that cane on the carrier, and 2 or 3 men will feed the carrier with 1,500 or 2,000 tons a day. That is one of the economies.

We have also economized by increasing the capacity. The sugarhouse that will turn out 1,500 tons of cane, or the product of it, to-day can, of course, produce sugar much more cheaply per pound than one turning out 200 tons of cane, because the same amount of intelligent labor is required in the 200-ton house as in the 2,000-ton house. In other words, the vacuum pan discharging 300,000 pounds of sugar a day can be operated by 1 man just as easily as the one in our sugarhouse at the experiment station of 2,500 pounds a day. It takes just as much expert intelligence to run one as the other. Now, the house that can turn out 300,000 pounds per day can do it much cheaper than the small one of 5,000 pounds; hence improved machinery has saved our sugar industry. The time was when we received about 10 cents a pound for sugar—when I first went to Louisiana—and we sold our last at 4 cents and 4½ cents, different grades of sugar.

Q. Is that sugar refined?—A. Yes. It is not, perhaps, in your sense refined; it is the commercial sugar, as it is known on the market.

Q. (By Representative OTJEN.) It is almost white?—A. It is what we call "off whites" and "yellow clarified."

Q. (By Mr. CLARKE.) About No. 16 Dutch standard?—A. Yes; considerably above that. No. 16 Dutch standard is unrefined. We have, perhaps, a dozen sugar houses that absolutely granulate it. It might be proper to tell you the difference between granulated sugar and white sugar. The granulating is simply running the "off whites" through a machine or drum that is revolving. The sugar coming in at one end meets perfectly-dry steam coming in at the other, which takes the last particle of water from it, preventing the cohesion or cohering of the particles. That is the granulating process. The sugar that has not been granulated will cake on account of the little moisture.

We have a dozen or more sugar houses that granulate the sugar; but as the Louisiana crop is consumed in a few months, we do not find it profitable to granulate because the "off white" will sell readily in the market, and it will keep a few months without undergoing the process of getting lumpy.

Yellow clarified is a refined sugar that goes on the market (very similar to what we call "Coffee A") throughout the country. It has a light golden tint, and that golden tint is given it artificially in the sugar house. We put that sugar on the market and it meets all the requirements of ordinary family consumption.

I might say in passing that our sugar houses have been forced to refine sugar by virtue of the want of competition in our markets. We have but one buyer. That is the American Sugar Refinery. Hence we have only a few sugar houses

unprepared to make refined sugar whenever we feel that the prices they are willing to pay for unrefined are not satisfactory. We refine it then ourselves and throw it on the market. While it is probably not best for our sugar houses to refine sugar ordinarily, it is decidedly more profitable to refine than to take whatever we can get from one purchaser.

Q. (By Representative OTJEN.) It is a lever you have?—A. That is right. Whenever the trust will pay us a fair price for 96 centrifugals, we make them. We can do it easier and make a larger profit. But whenever the price falls below such a point as will leave us a profit, then we refine and put the refined sugar on the market.

Q. (By Mr. FARQUHAR.) Then the so-called trust has no contract for the whole of your output?—A. No; none. They have in the Hawaiian Islands, but not with us. It is an individual contract made before the season begins. Several planters contracted before the last season to make 96 centrifugals at a given price during the season.

Q. (By Representative OTJEN.) What is the yield of Louisiana sugar per annum?—A. We will make 300,000 tons this year. That is not enough; we should have made 400,000 tons; we expected to do so.

Q. That is an increase over preceding years?—A. Yes, except one. I will state that the frost of 1899 was very destructive to our cane crop, and we did not make more than a third of a crop last year, 1899. The crop of 1898 was damaged, if you will remember, by a very wet fall; we had rains after rains all through the fall, and as a result we had a very green succulent cane that gave us very little sugar. This crop is the first approach to the crop of 1897, which was the largest we ever made. In 1897 we made about 340 odd thousand tons; this year we made 300,000 tons.

Q. (By Mr. A. L. HARRIS.) Do you use machinery in the rice fields?—A. We have adopted in the last 10 years the most improved machinery that has ever been used in the growing of rice. It is, with some modifications, the process adopted in the West for raising wheat. We break our lands with gang plows; we harrow with enormous 4-horse harrows; we seed the rice with grain drills or broadcast seeders, either one; then we harvest it with self-binder harvesters, and then we use steam thrashers. We did not see how we could make much on old methods, and the result is we are raising rice very cheaply. When I saw in the Hawaiian Islands this year the Chinese transplanting the rice by hand at intervals a foot apart, in water a half foot deep, and claiming to make a profit, I could not see it, while we were not growing very wealthy with the processes we adopt.

We have then, besides the improvement in the methods of the growing of the rice, a wonderful development in the last 10 years in the rice mills. There is hardly a village of 500 inhabitants in the rice district that has not a first-class rice mill. I do not know that you are familiar with rice. We first thrash it and get the rough rice. That is the marketable form to the farmer. He either sends that to the mill, as the Western man does his wheat, to be milled at his own expense, or for toll, or sells it in that condition. Our mills are ready either to buy it or to work it up on toll. These mills take the rough rice and convert it into the condition you see on the market, from head rice down to broken particles, to separate it and make rice polish, rice bran, rice hulls, and the various grades of rice all the way from head rice down to very small fragment rice. We have machines that take it and separate it into different classes, and it is sold according to its class. Good head rice is worth much more than the other; and that rice that will give the largest amount of head rice is the one that gives the greatest profit to the farmer.

Q. (By Mr. CLARKE.) Is it necessary that rice fields should be covered by water?—A. We have found it so; not absolutely necessary, but necessary to be profitable. Five or 10 years ago probably one-third of the rice grown in southwest Louisiana was what is called Providence rice. That country is very flat. There is an under-stratum of clay that renders impervious the soil, and all water that falls upon it is held by running an embankment around the field to retain it. We were enabled to make for 1 or 2 years considerable quantities of Providence rice, but in dry seasons we made nothing, hence we have abandoned Providence growing entirely. We now make it exclusively by flooding. Another thing that has done away the Providence process is the immense amount of money that has been spent in erecting canals for flooding our rice fields, coming from the nearest streams. I believe at least \$5,000,000 have been spent in that way. There are 300 miles of these large rice canals, some of them 30 miles long, and every tributary farmer draws water from that canal.

I may say in passing that I am in charge of the geological survey of Louisiana. Prof. George D. Harris and his assistant, Mr. Pscheco, are now in the field. Two

years ago we discovered underlying this country a bed of gravel nearly a hundred feet thick, which furnishes an abundant supply of water, and we have since then bored 800 to 500 wells all over that country. The water comes within a few feet of the surface everywhere, and by putting in small pumps, we are enabled to irrigate the fields without any trouble. Those wells are being bored now at the rate of 10 to 20 a day. The well borers are at their very busiest, and I can give you no conception of the wonderful activity that is now displayed in our rice fields. Governor Shaw, of Iowa, has a 1,200 or 1,500 acre farm down there. I don't know whether his field is on our side or the Texas side. This same condition runs into Texas up to Houston—the same lands.

Prior to the last 15 years these lands were practically worthless. They were used for cattle and ponies. They were discovered to be valuable for rice culture, and they have been redeemed. A good deal of the land belonged to the United States Government, and a great deal to the State of Louisiana—the swamp lands. The lands have all been bought, and to-day they are being exchanged at values of \$30 and \$50 an acre.

Q. (By Mr. CLARKE.) At what stage of growth of rice are the fields overflowed?—A. The fields are usually overflowed when the rice is about 6 inches high, unless conditions prevail that require flooding to get the seed up.

Q. (By Representative OTJEN.) And then how long?—A. The water is kept on the land until harvest time. The field has to be allowed to dry sufficiently to permit the use of binders. That country being very near a dead level, you can inclose an 80 or 100 acre field within a levee, and use improved implements to great advantage. We can't use the binder on the river, because the field from the river back to the swamp is such that we have to have a levee at intervals of probably the width of an acre, and it does not give room to use a binder with any success, hence we use the sickle for harvesting on the river. Our levees are arranged in both places so as to get the water 4 to 6 inches deep over the rice field, and at a given point.

Q. (By Mr. CLARKE.) Is it healthy to live in the rice region?—A. I understand so, and I have heard no complaint of the climate on that account. I think our last election showed that we have 7,000 voting Northern men down there, who have come from Iowa, Illinois, Nebraska, and they seem to be healthy and enjoying life. They have been there from 1 to 15 years, and I hear no complaint from them. The summer there is very cool and pleasant. It is right on the Gulf of Mexico, not over 10 to 50 feet above it. We have no cold there at all scarcely, and rarely have a frost, and hence it is a delightful climate to live in. Among the old creoles that have occupied this section of the country since its settlement you will find as many octogenarians as you would anywhere else in the world. We regard it as extremely healthy, and with the artesian wells they get an abundance of drinking water of the purest character.

Q. (By Mr. FARQUHAR.) Is your cultivation of rice profitable in Louisiana?—A. Extremely so, just now; particularly in this Southwestern country, where these improved implements can be used. You can imagine so when, as I told you just now, the land advanced from zero to \$30 and \$50 an acre.

Q. How is it with your sugar crop? Is that profitable?—A. That depends largely, as in all other industries, upon the man managing it. That is one of the instances where there is more in the man than there is in the land, and an economic and intelligent administration of a good sugar estate will frequently bring profits where others right by the side of it fail.

Q. What effect has the tariff on the imports of both your sugar and your rice?—A. Our sugar crop in Louisiana only amounts to about one-seventh of the consumption of the United States. Our present consumption is a little over 2,000,000 tons—the Louisiana grown only about 300,000 tons. Our present crop of rice in Louisiana, Texas, Carolina, and Georgia is not one-half of the consumption of the United States. So that the tariff is of great value to both the sugar producer and the rice producer. At the same time it will be years before we can hope to attain a quantity that will be equal to the consumption.

Q. (By Representative OTJEN.) The production of rice has rapidly and largely increased in recent years?—A. In Louisiana enormously. We now grow more rice in Louisiana than in all the other States put together.

You will find in your library here a history of New Orleans, in which I wrote last year an article upon the development of the sugar industry in Louisiana. You will find every year there from 1794, the introduction of cane into Louisiana, up to this year the whole production given there officially. You will find also the tariff that has been fixed. Sugar has been fortunate enough to have a tariff every year since its inauguration in Louisiana in 1794, before Louisiana was admitted to the Union. During the Monroe Administration, in 1812 to 1815, we

had 5 cents protection a pound, and the only time we have had free sugar was during the bounty period. During the first year of the war we lowered the tariff to one-half cent a pound. That is the lowest we have ever had it except in the bounty period.

Q. Have you tried to produce beet sugar in Louisiana?—A. Yes. It has been tried everywhere south of the Ohio River. We can not grow the beet successfully from a sugar standpoint anywhere in the South. We can grow the beet, but there is not enough sugar in it. We have made in the last few years a number of experiments with what are called winter sugar beets, and one year we made a very great success of them. We grew beets containing as high as 18 per cent in sugar. We planted in September and October and harvested them in January, but the next year the frost of 1899 came along and did not leave us a beet. It is a crop that we can not rely upon; nor can we grow the beet in the summer time, because of our climate. Rains are very destructive to the sugar content of beets, and during our summer months we have a deluge. In fact, it is that deluge that makes sugar cane and rice fields profitable. Our heavy rains fall in June, July, and August. The sugar beets that we harvest in October weigh 10 to 13 pounds and will not have 2 per cent of sugar in them.

Q. (By Mr. A. L. HARRIS.) How often do you have to plant your sugar cane?—A. In Louisiana we, as a rule, adopt what is called triennial rotation—once in 3 years. We plant first in corn, and lay by in cowpease. The corn is harvested and the stalks are cut and the pease are plowed under with large 6 and 8 horse plows, and the land immediately put in cane. We plant in September and continue at our convenience up until March. We let the stubbles bear another year. At the end of the second year we plow up and put the land back in pease again. The pease give us a nitrogenous crop of 120 to 125 pounds to the acre, and as cane is a great nitrogenous crop, in that way we supply the fertility of our soil and keep it up. There are some planters who grow the cane, particularly in the extreme southern portion of the State, 2 years in stubble, making a quadrennial instead of a triennial rotation. Then we have a few sugarhouses whose interests are so great that they make what is called succession cane, that is, make it all the time. In other words, they plow up the cane and plant right back again, but they only follow this plan when the sugar houses demand all the cane their lands will produce.

Q. (By Representative OTJEN.) That is wearing on the land, is it?—A. Very; extremely so, because, as I state, the cane is a great nitrogenous crop, and a crop of cowpease and corn helps to grow large crops of cane, and keeps up the fertility of our soil. I may say, also, further, that we use fertilizers very largely. Our fertilizer is usually along the nitrogenous line—cotton-seed meal and tankage, with small additions of acid phosphate.

Q. (By Mr. CLARKE.) What is tankage?—A. Tankage is the refuse from slaughterhouses—the waste. Everything on earth they can't use in any other way in a slaughterhouse, they put in the refuse house, and after getting all the oil out of it, it is sent down to be used as fertilizer for the soil, and it is called tankage. It usually consists of scrapings, blood, bone, meat, hides, and hoofs.

Q. (By Mr. FARQUHAR.) Condemned animals?—A. No; they make use of them for soap. This is just what can't be utilized in any other way, and I understand that since the economy in the slaughterhouses was introduced this constitutes a large part of the profit of the houses—the saving of this tankage.

Q. (By Mr. CLARKE.) What is done with the molasses?—A. Our molasses up to a few years ago had no sale at all. A few years ago we threw it out into the streams and let it flow off, but the introduction of tank cars has made it possible to realize from our molasses now a profit. The tank cars are brought up to our sugarhouses, and the molasses pumped right from our tanks into them, and we are getting from 3 to 5 cents a gallon in those tanks.

Q. (By Representative OTJEN.) Where does it go mostly?—A. It is shipped to Chicago, Toledo, Buffalo, and quite a number of places, to be mixed with glucose, and is sold as molasses. We import almost 3 times as much glucose sirup into Louisiana every year as we sell of the finished Louisiana molasses. One barrel of our Louisiana molasses mixed with 3 barrels of glucose will give us 4 barrels of nice Louisiana sirup.

Q. (By Mr. CLARKE.) In that way all the molasses is utilized?—A. Partially; not all; we feed a great deal of it. Our planters use it largely for feed for stock. It is worth more for feed than 3 to 5 cents a gallon to the planter, but the planter will make from 3 to 5 times as much as all the stock can consume. I am speaking of molasses from these different sugarhouses where they exhaust the sugar. We have still a remnant; probably one-fifth of all the production of the State is made in open-kettle sugarhouses. In these open-kettle sugarhouses we simply evaporate in an open vessel, clarify very thoroughly, and then put the

sugar in hogsheads to drain, and the drainings from that constitute what is called open-kettle molasses. That is valuable, worth from 80 to 50 cents a gallon; that is, not adulterated. When mixed with white glucose one gets a dollar a gallon readily. It is the demand for this molasses that keeps alive those open-kettle sugarhouses. If it was not for that they could not live. We get from 80 to 50 cents a gallon when it is properly made. There is a great demand for it. I doubt if you could get a barrel of it at this season of the year, there is such a demand for it.

Q. What is the principal use for molasses after it reaches the market?—A. Consumption, eating, after mixing with glucose. Then it sells all over the country as Louisiana sirup. It goes into retail consumption. Upon an analysis it is easily detected, because our glucose is a right polarizing sirup, and you frequently find a mixed molasses that will polarize 104 to 105, whereas the maximum of pure sugar is only 100.

Q. (By Representative OTJEN.) Showing that something has been put in?—A. Showing that it is corn sirup, which is entirely different from sugar. It is glucose, as we call it; glucose, maltose, and dextrine, all 3 of which polarize heavily to the right, and, therefore, when mixed with our cane sugar the aggregate polarization to the right is much larger than sugar.

Q. (By Mr. FARQUHAR.) Do you raise any sorghum in Louisiana?—A. Large quantities of it for stock feeding. Our sorghum has a facility for suckering 3 or 4 times in a year, and we get from 3 to 4 crops a year, and hence it makes a very valuable grain feed for our mules and stock. We never make sugar out of it. We used to try to, but found it impossible to do so.

Q. (By Mr. A. L. HARRIS.) What are the hours of labor on your plantations?—A. Our labor all over the State works from sunrise to sunset.

Q. What is the average number of days employed in the year?—A. Just as many as the laborer wants to make. We have a good many hands that make 300 work days a year. I would say that the average hand in Louisiana in the sugar district will certainly make over 200, and a good many of them 300 days. In the extreme winter, after the crop is taken off, the plantation has no immediate use for all of its hands, and may lay off a lot of them during the rainy season of winter, but there are some that work the whole year round. I had some working for me that last year I paid for over 300 days' work.

Q. About how many days does it take to make a rice crop?—A. We plant all through April and May, and harvest from the last of July up to about the middle of September. Then the threshing is done whenever we can get those traveling threshers that pass through the country. They are numerous, and probably one man will thresh to-day, another to-morrow, and so on, in passing through a community. Large rice planters have their own threshers, and they commence as soon as the rice is cut, and continue until it is finished. As a rule, the rice planters have far more leisure time than the cane planters.

Q. How long does it take to make a cotton crop?—A. I would like to premise further on the cotton and to say that our State is divided into 2 distinct classes of cotton farmers or planters. The first of these are located in the Mississippi Bottom, beginning at or above Baton Rouge and running up to the Arkansas line, constituting the Jensas Bottom, with an area of 4,000 or 5,000 square miles. This is the large cotton belt of Louisiana. Then coming down from the north-west and running down below Alexandria is the Red River Bottom, varying in width from 2 to 10 miles, which is a most magnificent cotton section. Between those is what is called "the hill country," consisting of land covered with oak and hickory, mixed with short-leaf pine. In these hills you will find a large number of small farmers, or what we designate planters, who grow cotton and do a great deal of their own labor, but at the same time grow everything else nearly. When we get over again into the alluvial bottom lands you will find large estates owned by individuals, many of whom are absent. They do not live on their places. These places are nearly all worked on what is called the shares, or renting plan.

In the hills the renting or sharing is the exception rather than the rule. The owners cultivate their own farms. They grow corn, oats, and forage crops, have small quantities of stock, raise their own poultry, make their own butter, kill their own meat, and live well. They hire mainly the help that they need during the season.

In the alluvial section the negro becomes a tenant either as a sharer or as a renter. Both systems prevail there to some extent. If I furnish the land and the mules and the house for him to live in and the firewood and the feed for the mules, the negro will work the crop and feed himself, and at the end of the season we divide in halves. That is the system adopted there for sharing.

The renter pays a stipulated rent, either in money or in cotton per acre for the land, and he will own his own mules and run the place. From what I have just

said you would imagine these laborers supplied themselves. They do not. Either the owner of the place advances to them or they are permitted with the landlord's consent (in our State we have a landlord's lien which is prior to everything else) to go to some merchant and get advances, for which, of course, big prices are paid. And we have, unfortunately—in my opinion, unfortunately—what is called a crop-lien law that permits any and everybody to rent land and then mortgage the crop to secure advances. There is no crop existing, but he is going to make one, and on that he makes the mortgage. On that system we have been running 25 years, and it has been very deleterious to our agriculture, in my opinion.

Q. (By Mr. FARQUHAR.) Does that plan keep the cropper always in debt?—A. Always in debt. It is used there very largely. The profits are necessarily abnormally large, and there is a risk to the advancing merchants. They generally have an agent that goes around through the country and reports upon the crops, and the supplies are limited to the condition of the crop.

Q. What is the interest charged on that lien?—A. That varies very much. From 20 per cent up. I do not know of any less than 20 per cent. It probably runs to 200 per cent. When I say 200, I mean it. Frequently they will buy stuff in August, and may pay for it with the picking of the first crop in September or October; and when you calculate the annual interest, it is 200 per cent. That is what I mean. I do not mean to say that they are charged that rate throughout the whole year. I regard this system of farming as being very detrimental to the section of the country in which it is practiced.

Q. Have you many white farmers in your hill country?—A. All white there.

Q. Do these white farmers contract debts, too, under this lien?—A. They did, until the last constitutional convention, rather heavily. But the last constitutional convention gave them each a homestead, which required a man to carry his wife before a notary and get her signature as well as give his own before they could waive their homestead; and, like most things, it became fashionable throughout the community not to waive. Hence, the constitutional convention that adopted that homestead law has almost completely made a revolution in the habits of those small farmers. They will never waive now. Heretofore they have been conducting their business upon what is called the mortgage system. I might explain by saying that in Louisiana, unlike most other places in the United States, we have had a law coming down to us through the French that permitted the mortgaging of an estate and permitting the husband to do it without the consent of the wife, and we go by estates in Louisiana and not by acres and farms. It has worked in many instances great hardships, and it also has been conducive to a great deal of prosperity in the past. If I mortgaged an estate known, for instance, as Bellaire, everything on Bellaire went with it—mules, horses, and, before the war, negroes. Now household and kitchen furniture is included unless it is excepted in the mortgage. That system was established in order to create a credit, and it prevails except in the case of the small farmer with his homestead.

Q. That is a remnant of the Roman law?—A. Yes, of the Roman law. You know our laws in Louisiana are based entirely on the Code of Justinian. We have our civil law coming down to us through the Code Napoleon.

Q. (By Mr. A. L. HARRIS.) To what extent has the crop lien prevailed in other States that you are familiar with?—A. It is just as bad in Alabama. It is a curse, when it was intended to be a blessing. After the war, the difficulty we had in the South was to get money to farm on. Recollect, we were left flat without means to operate with, and something had to be done by which we could get money to follow our agricultural pursuits. Almost every legislature in the South created a lien law to provide farmers with a credit. It was asked for by the best people. But it was found to be in the end detrimental, because a man, as soon as he gets credit, is very apt—even a white man—to go too far into debt; and it does not make any difference whether you are getting the money at the end of the year or not, you run into debt again next year and you come to rely on the merchant to run you.

Q. Is there any hope of a change?—A. Oh, yes; system is employed less and less every year. The "advancing" merchants are getting fewer. The establishment of banks throughout the country ready to loan money to a good man at low interest has caused our merchants to leave the lending alone. All our borrowing that is done to-day is done from the banks. We have made wonderful improvements in the last 10 or 15 years, and we are beginning to have an abundance of our own. Our banks are all prosperous.

Q. (By Mr. CLARKE.) Are those banks State or national?—A. They are mainly State banks in our smaller towns, but in the large cities we have national banks. We have national banks in Shreveport and Monroe and St. Charles; at New Orleans we have a whole lot of them. But in the small towns, county seats, they

are mostly State banks. Our State has a State inspector of banks, and we have a pretty thorough control over them. I want to say that our present national-bank law is based on the old Louisiana law in a great many of its provisions. New Orleans paper was worth its weight in gold before the war, and our banks were widely known. The word "Dixie" comes from the soundness of the New Orleans dollars. The boats went down the river to get the "Dixies" or \$10 notes at New Orleans, and that is where the word came from. They were known all through the Mississippi Valley and everywhere else.

Q. (By Mr. A. L. HARRIS.) Have you any manufacturing interests?—A. Yes; in the State of Louisiana we have 6 large cotton factories, 2 of them being in New Orleans. We have also 2 large knitting factories. We have a large cotton mill in Monroe, 1 in Shreveport, 1 in Washington, and 1 in Clinton. We have got quite a start now, and I would not be surprised if we would not have 2 or 3 dozen more in the next few years. Every neighborhood is starting to organize one. We have organized on the novel plan which has succeeded so well in North Carolina: Shares worth \$100, each person subscribing for 10 shares and paying \$1 a share a week. These I have mentioned were organized last year that way.

Q. Is the number of factories increasing?—A. Yes; we only had 3 two years ago. We have doubled the number in the last 2 years, and will, I think, increase very rapidly in the near future.

Q. Does the presence of local factories give a better profit for your cotton?—A. Yes; and it does this: it diverts and takes a great deal of labor from our fields and puts it into the factories and gives an increased demand for our small products, butter, eggs, etc.

Q. (By Mr. FARQUHAR.) Where do you find a market for your cotton goods?—A. I believe we make mainly coarse goods. I am not certain, but I think they go mainly to China. We have 2 New Orleans mills which are very profitable, the Maginnis and the Lane mills.

Q. (By Mr. A. L. HARRIS.) In what direction do you go to get to the market?—A. I will lead up to that. We had last year a desire to open up quite a trade with Japan in raw cotton, and we have sent a number of shiploads direct from New Orleans to Japan; and when I left the other day there were 2 Japanese commissioners there studying this trade with a view of ascertaining its conditions.

Q. (By Mr. FARQUHAR.) So that they can manufacture their own cotton?—A. Yes; you know they manufacture largely.

Q. (By Mr. A. L. HARRIS.) What is the average wage for your field hands where they are employed by the day?—A. In the rice fields I should say \$1 to \$1.25 is about the average pay for a laborer. That, of course, covers a home, a garden, and firewood, and things of that sort, but it does not cover rations. In the cane fields we pay from 75 cents to \$1.50, according to location and the character of the hands. In the cotton fields we have no regular wages, as I have just explained. But the few white farmers that hire for wages usually feed from their tables and pay from \$3 to \$15 a month. But, as a rule, the wages in cotton are so much a day while chopping cotton and so much a day for picking cotton. That is the way we run in the South.

Q. Is the payment made in cash?—A. In a sugar plantation the following rule is adopted: Nearly every large estate has a store; every night the timekeeper gives the workman a token representing a day's work, giving the stamp of the place on it.

Q. A metal token?—A. Sometimes it is metal and sometimes it is horn. They go backward or forward all the time on the place, and that token is receivable in the stores for anything that man wants to buy. If they are not used up by the 15th or 30th of the month they are redeemed in cash. Everybody in a sugar plantation is paid off on the 15th and the 30th. If he has spent his chips, as the tokens are called, he does not get his money, but he does get it if he has not spent them.

Q. Are stores run in connection with the rice plantations?—A. Only if the owner is a large planter. It does not take nearly as many men to run a rice plantation as it does to run a sugar plantation. The rice planter only needs men to break the land. Keeping the crop between the planting and the harvest requires only about 1 man to three or four hundred acres; whereas the sugar planter has to have a large gang of hands all the while.

Q. (By Mr. FARQUHAR.) Do you have any foreigners engaged in cultivation down there?—A. Oh, yes; in the last 15 years we have imported between 25,000 and 80,000 Italians. There are also some Germans and Swedes. I do not recall any others.

Q. Have you any French immigration?—A. Not of that character. Our French immigration is rather of a higher order. Some of our planters prefer the Italians and some the negroes. Those that have stores prefer the negro, because the negro will spend 95 cents out of every dollar he gets, while the Italian will hardly spend a nickel. He keeps everything he can get.

Q. (By Mr. A. L. HARRIS.) Are the stores run at a large profit?—A. A fairly large profit. There is no risk there. They are fairly good. You go through that country and they are about as good stores as you will find. The stores are numerous.

Q. Are these labor tokens good at any store?—A. They are not taken by any store, but they are swapped around.

Q. Have you anything further to say about the tenant house?—A. Yes; in Louisiana every tenant is given his house.

Q. What privileges has he in connection?—A. He has the privilege of a garden and firewood, and upon some estates where they have pasturage he is permitted to have a cow or something to go on a pasture.

Q. Please describe one of those average tenant houses.—A. On the large plantations the houses are arranged in rows, probably 30 or 40 cabins together. The cabins usually contain from 2 to 3 rooms with a porch and with a kitchen in the rear, and on both sides of the street the houses are usually about 30 or 40 feet apart, occupying the row pretty closely. In the rear of each house is given probably an area varying from a quarter to half an acre for a garden. The woods are open and free for the tenant to go and get his firewood. Every Saturday evening the carts are put at the disposal of the hands to go back into the woods and get all the wood they want free of charge. These houses are very expensive to the planter, because on a great number of the large sugar estates they have sometimes a hundred each, and they will cost \$300 or \$400 apiece.

Q. Are the tenants careful of the property?—A. No; they are not careful; they require supervision in this matter just like they do in everything else. The negro is not careful with anything.

Q. Are the houses well furnished?—A. No; the tenants do not want them well furnished. You could not make them sleep in a room like this one we are in. The negro does not want a glass window, because he does not want anybody to see what he is doing. He wants a deadlight to shut out everybody. He would rather have the natural luxuries than the artificial ones—plenty of air, etc. I am sorry to say our negroes are not careful in that regard at all. They do not want to spend any money in what might be called unessential improvement; though I think they have beds with mosquito nets; we sometimes have mosquitoes down there.

Q. (By Mr. CLARKE.) Is it respectable for white men to labor there now with their hands?—A. Yes; not only respectable, but such labor is the admiration of everybody in that country. You can find some of our best and wealthiest men so engaged—I have seen a millionaire plowing with a 4-mule plow.

Q. Does that condition differ from the one before the civil war?—A. There was no necessity for such labor before the civil war. There has been, however, always a feeling among all Southern people that they should do the work when there was necessity, and when there was no necessity not to do it. I have seen cases before the war where wealthy and aristocratic farmers would suddenly break all to pieces financially, and I have seen their children go to hard work, work like negroes, and yet be received in the best society, as they had always been. But a man that owns a lot of hands either for to-day or to-morrow, or for a lifetime, and can make use of them to do the work probably better than he can do it, on account of his physical ability—I do not care where he is from, North, South, East, or West—is very apt to make them do it and not do it himself. I have investigated conditions in California, and I find that the man in California uses the Chinese just as we use the negroes in the South. Whenever we can make them do at 75 cents a day what we can do and then turn our attention to something else and make more than that, we are very apt to let them do it. But so far as the respectability is concerned, I will say to you to-day that our people admire the man that has the pluck in him to get down and work, if he is honest and intelligent. I have done as much hard work as any workman in the North, and I believe I have the entrée anywhere I want to go in the South. I have a sugar school with a course of 5 years, and I am director of it. I make every boy that comes there plow, plant, hoe, ditch, cut cane, run the boilers, run the engines, run the machinery of the sugar house, and do everything that is done on the place, and, as I told you before, I have had a millionaire's son on a 4-mule plow, and I have kept him there while the thermometer was ninety-odd degrees in the shade. So you can understand my position on labor. I believe in every man laboring when there is necessity.

Q. (By Mr. A. L. HARRIS.) Are your public school facilities good?—A. Our public school facilities are increasing.

Q. What is the school age?—A. I think the school age is between 6 and 16. Our public schools are improving rapidly. We are taxing ourselves very heavily for

public schools, and although we have a preponderance of colored schools, I do not think the negroes pay scarcely any taxes. I think the taxes collected from the colored people from our State amount to but very little, and yet our public school fund is divided according to the number of children pro rata. In addition to that our State appropriates annually a large amount to the maintenance of an agricultural and mechanical college for the colored people exclusively, and we appropriate a considerable amount for a normal school, colored only. So our negroes are a heavy tax on us, constituting a very large part of our population and paying no taxes—none to speak of. Yet not only do we have to educate them, but our court costs and our jail costs and things of that sort amount to a very large sum.

Q. Is your course of study in the country schools well adapted to agricultural people?—A. No; we have the same public school curriculum that prevails almost everywhere else in the United States. And just here I wish to emphasize that our public schools are not adapted to the wants of any agricultural community whatever. We have made speech after speech before the farmers' educational institutes and educational organizations, and we have about persuaded a great many parishes in the State to institute an amendment to our public school curriculum by adding agricultural and natural sciences. Three-fourths of our boys and girls in the public schools of the hill section never get beyond the public schools. They go to farming after leaving the public schools. They have never studied a particle of any kind of science; they have not the slightest knowledge of the composition of the soil they are going to work; they have no idea of the nutrition of animals; they have no idea of the plants; no idea of fertilizers; and yet they are called upon to spend a lifetime in working at a profession or occupation of which they have not learned a word at school. It is the greatest monstrosity of the present age. We have taught them all about the geography of the world—the political divisions; we have taught them all about history from Rome to the present day; we have taught them the grammar of English as it is spoken; we have taught them the 3 R's—reading, 'riting, and 'rithmetic; but we have not said a word to them about their future life work, and in my opinion it is a great blunder. But we are now adopting measures in Louisiana by which we can remedy this, by giving to our rural schools a course of nature studies, by which a boy can get some idea and knowledge of the life before him.

Q. (By Mr. CLARKE.) You propose to have this in addition to the other branches?—A. Yes; we have several parishes in which it has been already inaugurated.

Q. Have you any technical education for farmers in your State?—A. We have an agricultural and mechanical college, the origin of which you are already familiar with. They were established by act of Congress in 1863, during the war, giving to each State and Territory so many acres of land for each Representative and Senator. Every State has one. You are also familiar with what is called the Morrill bill, granting \$25,000, beginning with \$15,000 and gradually increasing up to \$25,000 for each State and Territory in the Union. Under this grant from Congress was established our two agricultural and mechanical colleges, one for whites and the other for colored. The college for whites is associated with the old Louisiana State University at Baton Rouge, and is in a very prosperous condition. It has, probably, to-day nearly 400 students. It is exclusively confined to the male population, as we do not have mixed schools in our State. This university has a literary and scientific course, covering general science and agricultural and mechanical subjects. It also includes the Audubon Sugar School. The Audubon Sugar School was established first by the sugar planters of our State; instituted and run by them for 4 or 5 years. It was started under my direction, and finally the State took hold of it and adopted it, and the State is now carrying it on. In the Audubon Sugar School the students spend 6 months in the study of the sciences and in the workshops of the agricultural and mechanical college. Then they go down 3 months in the year and work practically in the sugar house and sugar fields and laboratories of the sugar experiment station. There they do everything. We have graduated quite a number, and they are now filling positions wherever cane sugar is grown. We have probably 15 or 20 in Hawaii. The director of the experiment station there is one of my graduates, and was formerly my assistant. The director of the experiment station in Queensland was formerly one of my assistants. He has gone there on a contract for 5 years, at \$15,000 a year, made with the Queensland government to give instruction in sugar growing and sugar manufacturing. My assistant who graduated 9 years ago is now director of the experiment station of the Hawaiian Planters' Association of Honolulu, and he is getting \$5,000 a year and expenses. So our boys are doing well everywhere. They have added to our own sugar houses, of course, very largely. A fair proportion of the men running our sugar houses are our graduates.

We had a dozen Cubans in our school when the war for independence broke out, and of those 8 were killed fighting in the army in Cuba. We have a dozen or more in Cuba now. We have them in Mexico, in Porto Rico, several in the Danish West Indies, several in French Martinique and in Guadeloupe, and we have some in Mauritius.

Q. The education you give them, then, benefits your competitors?—A. We can not help it. You know science knows no boundary. You can not restrict science by political boundaries, and hence when we opened the school the question at once arose, What shall we do when we have applications from foreigners? Our people decided all we could do at first was to charge them an increased tuition, which we did until the State took hold of it. We have a State law that prohibits any charge at all for any instruction the State gives, and hence we are educating at Baton Rouge at the sugar school foreigners without a dollar of cost to them.

Q. You get the chief benefit yourselves on your own plantations?—A. Yes; our own plantations are very much benefited by it and are still aiding in the support of their experiment stations whenever it is necessary. I mention here, to show the interest of the planters in our State in advanced agriculture and improved methods, that they established the sugar-experiment station over which I preside 15 or 16 years ago and have already spent over \$100,000 of their own money in the equipment—contributed by them; and they have found it profitable, because they continue to support it. The improvements that are being made, and the better methods that are being adopted, are all largely due to the establishment of this experiment station and sugar school. We have educated a good many beet-sugar men also, and our graduates are scattered all through the beet-sugar factories of the West.

Q. Which do you think is the more beneficial to the local sugar industry, the experiment station or the school?—A. The experiment station is now more directly beneficial, because it develops methods and practices which the planter can utilize at once. The school educates a boy, and the boy has to develop himself in order to put his knowledge into practice, and it takes 6 years to do that. But the station, to us, is nothing more or less than a precursor, so to speak, of the planter. It simply develops methods to-day that are taken hold of by the planter to-morrow and carried into his field or sugar house.

Q. (By Mr. A. L. HARRIS.) How many experiment stations have you?—A. I have 3 in Louisiana—1 at Audubon Park, New Orleans; 1 in connection with the agricultural and mechanical college at Baton Rouge, and 1 in the northern portion of the State, at Calhoun. I might state to you that there is a noticeable interest in Louisiana in experimental work. Our State contributes heavily to it, probably next to New York; it makes the largest contribution from a State treasury of any State in the Union. When the sugar planters started this station at Audubon Park it proved of such great benefit that when the Hatch bill was passed here in Washington, establishing a station in every State and Territory and contributing \$15,000 a year, our legislature determined to divide that into three parts, giving one-third to the sugar-experiment station already established by the sugar planters, one-third to the station at Baton Rouge, already established, and the other third to the hill farmers in northern Louisiana, which I have described to you. They decided on that course and directed the board of agriculture to secure a location for the third station. This board invited bids from the different parishes, and there arose quite a competition between them as to which should have it. This ended in the parish giving all the lands, all the buildings, and all the mules, and equipping the station for the State. Since then that station has become a very valuable ally to those small farmers and planters. The State is contributing somewhere in the neighborhood of \$25,000 a year to its three stations, independent of the receipts from the United States Government. This station in northern Louisiana has also become a social factor of very great prominence. We have a North Louisiana Agricultural Society that holds its monthly meetings there. They have built a hall and hold the meetings on the ground. The people from the adjoining parishes attend these meetings, not only for the agricultural benefits, but for the social life involved in them. They come to see each other and find out what is going on. Once a year this society holds an annual agricultural camp meeting on the grounds of the station, lasting 3 days. We have already held 9 meetings. We have from 3,000 to 7,000 people on the ground during the whole 3 days. The adjoining parishes, through their police juries, as we call them—I suppose you call them county commissioners—contribute from \$25 to \$100 a year as a premium fund to be distributed there, and there is no charge. The mornings are spent in discussion of agricultural subjects by distinguished educators or farmers; the evenings are devoted to the examination of stock and other exhibits, and the nights are devoted to what are called question boxes. We meet in the big hall.

Any planter gets up and asks any question he wants to ask and it is answered by whoever can answer it.

Q. (By Mr. CLARKE.) Do the ladies participate?—A. Yes; the ladies come. There are fine woods and an abundance of water, and the people camp. They pitch their tents and camp and cook the same as on a fish fry, staying the 3 days. The station has caused a perfect revolution among the small farmers up in that section. It has introduced new methods, new plants, and new seeds, and it has been an object lesson to all—the study of experiments in the field. We have a fine dairy with 6 or 8 varieties of cattle. We also have 4 or 5 varieties of sheep and 4 or 5 of hogs. We have horticultural experiments, orchards and gardens, and tobacco barn. We also have forage crops, grasses, and fish ponds, together with laboratories. It has been a revelation to them; it has widened the whole of their mental horizon. Modern dairy methods have been introduced, and they are competing in the markets with first-class butter, though they never sold a bit of butter before.

Q. Has the effect of this new life been to make the farmers ambitious and enterprising and saving?—A. Yes; but the main gain has been to take their attention away from cotton as their sole money crop and teach them there are other crops besides cotton. This has always been a home-raising class of people. They formerly raised a little corn, but their lives were primitive. Their butter was a white product that looked a little like butter, but now they are making first-class butter and first-class everything. You will find the farmers in that country now up to date, equal to any farmers in any section of the country. They can write on agricultural topics and discuss subjects with a great deal of learning and intelligence, all brought about by the 12 or 15 years' work of the experiment station. Our sugar planters are perhaps the most intelligent body, as a rule, in the world. They are wealthy men, thoroughly educated; but the smaller farmers are what you might call the yeomanry of the country. The sugar planters are a cosmopolitan people; they have come there and invested their means in sugar plantations, and, while they were extremely intelligent and educated on many lines, they were not all well advanced on sugar methods, and hence they early felt the necessity of information of that character.

Q. (By Mr. A. L. HARRIS.) Do you make exhibits in these meetings?—A. Always; enormous exhibits.

Q. Any premiums offered?—A. We give from \$300 to \$500 every year in premiums, contributed by the adjoining parishes. Our police juries contribute from \$25 to \$100 a year for the premium list and wealthy, public-spirited citizens also add to the list, and the merchants give certain premiums. We publish a catalogue of the premiums every year, amounting to some \$300 or \$400. There is quite a spirited contest to get the premiums.

Q. Is the interest growing?—A. Yes. We usually have from 100 to 200 head of horses and mules on exhibition, mostly home raised. We have no trotting, no betting. We have cows in abundance, hogs, sheep, and various products of the farm. I saw a pumpkin exhibited that weighed more than 100 pounds.

Q. (By Mr. CLARKE.) Is it a good grazing country?—A. For certain kinds of grasses. It would not be from your standpoint, because your grasses will not do with us. With Bermuda as the foundation for pasture grass it is magnificent. Your grasses of the North will grow with us in the winter, and hence we have to change our pasture grasses as we go southward and get those adapted to our southern conditions. Our Bermuda grass will probably carry more cattle to the acre than any other grass in the world. It will stand biting right into the ground. It is what we call a grazing grass. It has stolons that run underground and shoot out at every point, and for that reason we have been raising stock very successfully, and we have a great number of bottoms growing various kinds of grasses. The whole country is very well watered, springs gushing out of every hillside. It is a little farmers' paradise almost.

Q. Do they make hay?—A. Yes, for home consumption; but there is very little of it sold because up to date there has been no demand for hay in that section; everybody raises his own hay.

Q. How long is the grazing season?—A. Taking our bottoms and hills together, it continues all the year. Our stock go into the bottoms in the winter and graze on cane, which is green then. Our Bermudas will last from April to November, and from November to April we carry them through in the swamps on the grasses not killed by the winter. We have a grass called the *paspalum dilatatum*. That grass remains green the whole winter with us and furnishes a large amount of grazing all through the winter, even with snow on the ground. If they do not prosper we put them on the cane. That grass is being disseminated through the North, and it is sold as Louisiana grass. You will find plenty of it advertised.

Q. Are the cattle gathered in the barns at nights?—A. On the farms, yes; they are brought up and looked after. Where they are grown in large numbers, as in some parts of the State, they are not; no necessity for it. Where they are milking cows on the farm the stock is all brought up.

(By Mr. A. L. HARRIS.) What is the earning capacity of your capital invested in farming, compared with investments in other industries?—A. I imagine, as the banks are loaning us money at a fair rate of interest, it must be better than banking in a small way. I do not know much about the profits in manufacturing, but it is certainly better than our Southern railroads, because most of the Southern railroads are below par in value. The Illinois Central is above and paying, I think, 5 per cent dividend; but I do not think you could get any of our farmers to farm with as low as 5 per cent income. We want a little better than that. I will say the State of Louisiana, as well as all the other Southern States, and I know them all pretty well, are in first-class, good condition just now; money is abundant; farmers are cheerful; improving their farms; diversifying their agriculture; less moving about than I have ever seen (I am referring to the whites); less disposition to sell; more endeavor to improve and embellish the home than I have ever seen in my life. We have great cause to congratulate ourselves on our present condition. There are fewer mortgages, less dissatisfaction, more home comforts, more education, more boys going off to school, more live stock being introduced, better attention being paid to farming, more fertilizers used, etc.

Q. You consider this change permanent, do you?—A. Not in the nature of things, no; because our staple crops are cotton, sugar, and rice, and if the bottom should drop out of either of them we would suffer. Our sugar and rice and cotton interests are prosperous by virtue of the fact that prices are fairly good for profit. Six or eight years ago our cotton planters had an awful time to make both ends meet, selling the crop at 4 cents a pound. With things that they had to buy higher than they are now, they passed through very desperate straits, so to speak. Rice and sugar are both liable to these fluctuations, and so is cotton. You all know how hard it is to make money when the chief staple crops of the country are below the cost of production.

Q. Will the present high prices induce farmers to overproduce?—A. Yes; in cotton. We can not overproduce rice and sugar for years to come, for the reason that the sugar crop is only one-seventh of the country's consumption. Our cotton crop has been depressed for years, until last year, by overproduction or underconsumption, which ever you choose to call it. There has been a dispute as to whether it is due to underconsumption, want of money to buy, or to overproduction; but we have made enormous crops of cotton up to two years ago, and those crops have depreciated the value of cotton all over the world, and made us sell cotton on the plantation for 4 cents, while it is utterly impossible under our best system to produce it at a profit at that price—you have to starve your labor to death if you do.

Q. Is your system of taxation satisfactory in your State?—A. I believe perfectly so. It ought to be, because our legislature represents the farming and planting classes of our State. Our legislature is composed almost exclusively of planters and farmers. I believe our State laws are all satisfactory to most of the planters. There are some few laws which are not, as I have intimated—for instance that crop-lien law. There is a difference of opinion on it, and hence it has never been abolished.

Q. Are your planters organized?—A. We have, first, the State board of agriculture and immigration, consisting of one farmer or planter from each Congressional district, together with certain ex officio officials of the State, among whom are myself, the governor, the president of our agricultural college, the commissioner of agriculture, the director of the experiment station, and the vice-president of the board of supervisors of the agricultural and mechanical college. They have an office in Baton Rouge, from which they are issuing a large amount of literature in regard to agriculture all the time. They organized farmers' institutes some years ago, and we have now farmers' institutes in 50 out of the 59 parishes of our State. At these institutes the farmers of the different sections of the State meet and discuss agricultural questions under the guidance of a director, who is usually either the commissioner of agriculture, myself, or some of our associates; and we carry to them, of course, all the information that we can relative to the subjects nearest and dearest to the farmers of that immediate section. If we are in the rice section we discuss mainly rice and other crops that go along with it. In sugar sections we discuss sugar making, sugar growing, and things of that sort, and in the cotton region we discuss cotton and grass and forage crops and stock and other things.

We also have a State Agricultural Society that has an annual meeting. It is composed of the farmers and planters of our State. They meet once a year and

hold a week's session at such a place as may be selected by their executive committee. The leading farmers and planters of the State meet and take part.

Then at each experiment station we have a local agricultural organization. The Sugar Planters' Association that established the sugar experiment station meets monthly in New Orleans. It was organized as far back as the seventies, and is perhaps the pioneer agricultural organization of our State. That has done more good perhaps than any other. It is composed exclusively of sugar planters, and, as they have annual dues and initiation fees, and so on, they carry with them considerable means. Then we have local agricultural clubs nearly all over the State; also in some sections of the State there are granges and a few alliances.

Q. (By Mr. FARQUHAR.) Do these granges and alliances enter into agricultural matters, or are they mainly political?—A. The grange has never had anything to do with politics; the alliance has. I can not answer definitely because I was never in either. They are both secret organizations.

Q. (By Mr. A. L. HARRIS.) Do you invite local talent to take part at the local institutes?—A. Yes; in every institute we try to select 2 or 3 local men to take part in the institute.

I would like to amend a little. I want to do justice to our State. Besides this agricultural and mechanical college we have 2 industrial schools, 1 located in extreme north Louisiana and the other in extreme south Louisiana, both of them largely attended and entirely supported by the State. They are industrial schools. Pupils are taught all the industries, besides, of course, the sciences leading up to them. Then, of course, we have normal schools, and also denominational schools. The Catholics, Methodists, and Baptists all have colleges in our State.

Q. Have you any suggestions to make as to the most practical way for the extension of our foreign markets?—A. We would like to see the Nicaragua Canal built, and would like to see our trade established with the Western world. The canal would bring the South closer to the West than it is. We are all heartily in favor of it.

Q. Southern people are in favor of the Nicaraguan Canal?—A. Oh, yes; we are all in favor of the Nicaraguan Canal; yes.

Q. Do you favor Government aid for our American marine?—A. I have never heard that subject discussed except the other day before our industrial convention. There it was discussed very thoroughly and some were opposed to it, but it ended by the convention passing a resolution indorsing the subsidy bill. There is a diversity of opinion on that subject, but the convention passed resolutions favorable to it.

Q. (By Mr. FARQUHAR.) Was that convention thoroughly representative of the Southern intelligence and the local interests?—A. That is difficult to say, because the cities predominated, and I do not know whether we had a full and free expression of the agricultural element in it. The agricultural elements do not get into these conventions very largely. Atlanta was well represented, and so were Nashville, Chattanooga, Birmingham, Montgomery, Mobile, Memphis, Houston, Galveston, San Antonio, Dallas, Baton Rouge, and Shreveport. All those cities were well represented, as were quite a number of small towns, but there was not a preponderance or anything like a fair representation of the agricultural leaders of the South there. Most of those were manufacturing, mercantile or commercial men. They were representative men though—you understand what I mean. They passed resolutions favorable to the canal, but only after considerable discussion.

Q. (By Mr. A. L. HARRIS.) What is the condition of your roads?—A. Roads are probably worse in Louisiana than in any State in the Union, first, because of the peculiar constitution of our soils, alluvial in origin, most of them hard to drain, easy to wear with the wheel, and therefore very difficult to keep in good condition. Another thing is the absence of material for road making; we have none. We are all interested in the problem. Our legislators are struggling with it. They have recently passed laws permitting the police jury of the different parishes to tax vehicles and to levy a per capita tax, or to require every man between the age of 18 and 60 to work under the direction of an overseer on the road for 12 days. The police jury of the parishes are now struggling with that question to see how they can best get good roads, and it is a question with us all, because our people are terribly in earnest about it. At a large agricultural meeting which we had at Calhoun last summer, we had representatives of the road machines present with their machines and rollers. The governor of our State made a speech upon the subject, and we had an expert sent down there by Secretary Wilson. Mr. Harrison appeared on the ground and constructed a quarter of a mile of road; that is, he commenced it, and we completed it. He showed us how to build roads, but I think he left under the impression that we had to do the best we could. It

was not a question with us of building the best roads, but the best we could, because we lacked material. Rocks are mighty scarce in our State, and building materials had to be made there entirely out of clays. We have a hard time in the lower portion of the State in making roads, but we usually adopt the gravel system, bringing the gravel in carload lots from the northern portion of the State, or the middle of Mississippi.

Q. (By Mr. FARQUHAR.) Wouldn't you better widen the tires of your wheels?—A. We have done that. We have gone so far as to exempt from taxation all wheels over 4 inches in width. And another thing I would like to call attention to is this: Our riparian parishes have but 1 road in a parish, which is right on the banks of the river, and all travel is along that 1 road, for the estates run from the river bank to the swamps. Then there is a ditch for every 100 feet, and that ditch has to be bridged and the bridge kept in order.

Q. (By Mr. A. L. HARRIS.) Has there been any decrease in your transportation rates?—A. I believe that since the creation of a State railroad commission they have regulated things a little better—more satisfactorily. They are working every day at it. Every complaint is met, and up to date the railroads and commissioners have got along very well. The railroads have done everything the commission required, I believe, and we are getting very satisfactory rates. I think, now; I mean we are not complaining about them. The great trouble with us in the South in going into truck industries is the heavy transportation to Northern and Western markets. These rates have prevented us from going into that business very largely, but that is a question for interstate railroad commissions rather than for our State commission, and therefore we can not touch it.

Q. Have you any suggestions to make in regard to increasing the power of the Interstate Commerce Commission?—A. I am not sufficiently acquainted with their power now to say whether they ought to have any more latitude or not, but I do say this: There is considerable complaint in our country that the commission is not doing what we expected it would do. In other words, we thought, that when established, it would regulate rates to such an extent as to give an opportunity to the farmer of putting his products on an equality with the rest of the world, in the markets of the world, and we have not been able to do so. Complaints arise every now and then in our State that such and such a place is getting rates that we can not get, and that condition of affairs gives dissatisfaction.

Q. Have you a pure-food law?—A. I think not; I think all inspections are left to our cities. The city of New Orleans has a chemist who is entirely engaged in the detection of impure food.

Q. Is there any demand on the part of the farmers for a pure-food law?—A. There is quite a favorable sentiment toward a national law along that line, but we care as little as possible about having State laws, by virtue of the decisions that have recently been made whereby this whole package business frustrates to a large extent the State laws: so we would prefer a national law to a State law.

Q. Where would you rest the authority of the execution of the national law?—A. I would rest it with the national Department of Agriculture.

Q. Have you any law in your State to prevent the spread of disease among domestic animals?—A. No: not among domestic animals, but we have a law concerning disease among plants, and we need such a law as that for animals. We need more national legislation. Our veterinary surgeon, just a few days before I left home, was called to the parishes around Shreveport (Bossier, Caddo, and De Soto), and he spent nearly a week there in exterminating and destroying animals, and giving instructions to the police juries of those parishes whereby the stables might be disinfected and so on. The trouble was all due to a carload of animals brought from Idaho and Montana and sold in our State. We are suffering somewhat from the operations of the quarantine law concerning Texas fever. We are entirely within the Texas fever region, and in only two months of the year are we allowed to ship cattle to the Northern portion of the United States. We are counteracting the effect of that, however, now to some extent by improving our stock by the introduction of a better class of animals, and we are inoculating them as soon as received with Texas fever, and acclimating them. I left 25 or 30 fine animals in the hands of our veterinary surgeon, who was inoculating them when I left.

Q. Have you any amendment to suggest?—A. Yes. I think the United States Government ought certainly to prohibit just as much the importation from State to State of glanders as it does pleuro-pneumonia in cattle, for glanders is just as bad among horses and mules as pleuro-pneumonia among cattle.

Q. Does glanders ever break out locally with you?—A. No, it is always imported; it is always brought to our State, and they have had a dozen outbreaks since I have been living there.

Q. What are the conditions in other States in regard to agriculture?—A. I

should say all through the States there is a very healthy condition just now. Everywhere there has been a constant tendency toward diversification, the raising of home supplies, increased growing of stock, and increased growing of pasturage and forage crops. This has been going on ever since cotton worked down to its low mark. The present price of cotton is unexpected, and it will probably in the end be somewhat of a detriment to this progress, because the people will go back to raising it more extensively; but the increased price added to the home production of other articles has put our people in excellent condition all through the South. I do not think I can name a State that has not been greatly benefited in the last few years, particularly those that have been working along the lines of the farmer rather than the planter. I believe we can persuade our farmers and planters not to go too largely in cotton this present year, and can maintain them along the lines of agricultural diversification, that they have been in for a number of years, and let them pass over this present high tide of cotton, and I believe it is desirable to do so, because cotton can't remain at 10 cents, you know. We can flood the world with cotton any time we want to do so. The area to be devoted to cotton can be increased or decreased at will to any extent.

Q. (By Mr. CLARKE.) Is there any long staple cotton grown in Louisiana?—A. No. The long staple cotton is confined exclusively to the southern part of Georgia, including the islands on its coast, South Carolina, and certain parts of Florida.

Q. Has not there been an attempt made in Louisiana and Mississippi to grow a long staple cotton and yet somewhat resembling the Egyptian cotton?—A. I have made the effort for 8 to 10 years, not only at the stations, but in distributing seed to a hundred odd planters in our State, and it has been a failure.

Q. Did you get the Egyptian seed?—A. I got 8 or 10 kinds of Egyptian seed, and finally, after failure, I received the consular report from Mr. Penfield, issued from Alexandria, Egypt, in which he stated that the reason of our failure in Louisiana and Texas and other States was due to the fact that we did not get the proper seed and we did not have proper machinery and we did not cultivate it right. I sat down then and wrote to Mr. Penfield and also to Dr. David, of Zigzag, who is director of the experiment station in Egypt, and I got from both of them the purest Egyptian seed by mail. In the meanwhile I got the name of the roller gin that Dr. David ginned his crop on, and I sent to England and got one of the gins. I left no stone unturned to see that the Egyptian cotton was cultivated exactly like they cultivate it in Egypt, and I have been in correspondence with Mr. Edward Atkinson for 2 years trying to get him to get at the relative merits of the cotton I produced compared with that brought from Egypt to Boston, and I have now 2 bales of home-grown Egyptian cotton, which has gone on to Boston this fall to see what can be done with it. It should compare with the Egyptian imported cotton, but the profits are not there. The yield is too small for us. The growing of the Egyptian cotton is a question of irrigation. It is grown in a very dry climate and is irrigated periodically. We have got Egyptian stalks at our station now, whose roots are long, and they do not bring as much as our ordinary bush cotton this year. In our damp climate it is an impossibility to ever acclimate the Egyptian cotton and get identically the same cotton they bring from Egypt. I may mention that the Egyptian cotton was originally our sea-island cotton on our coast, but it has been differentiated there by that climate until it comes back to us an entirely different cotton. Any attempt to acclimate that Egyptian cotton will result in its coming back to long-staple cotton. The only part of the United States that is favorable for the growing of that Egyptian cotton successfully is the arid section of Texas, and there must be provided irrigation so that it can get periodical water.

Q. Do you think it would do well there?—A. I am stating that Texas is the only place in which we hope to make it succeed. I would think if it is going to succeed anywhere in the United States it will be in Texas. You know what Egyptian cotton is?

Mr. CLARKE. I do; but we would like to have your views as a matter of record.—A. The Egyptian cotton is woolly, coarse, rather long staple, and slightly colored. It has a creamy tint, that is largely used for making the balbriggan goods underwear, and it has a finish about it that we can't get our cotton to give, and hence, when we send our cotton to make the same goods, the goods, instead of having that creamy woolly color and texture, are more like our common cotton goods. Hence we can't suppress the introduction of Egyptian cotton. Our merchants demand those goods, and they will come, and no matter how much we make of other kinds we can't substitute for them. There are six or seven million dollars of that cotton introduced every year for that purpose. Our manufacturers have tried hard to find a Southern cotton that would take the place of it, and we have not succeeded as yet.

Q. Has there been any attempt made to grow *Peruvianum* cotton?—A. We have made the attempt, but Peruvian cotton is a perennial or tree cotton, and does not bloom until the second or third year; it would not survive our winters. I have two or three stalks of *Peruvianum* cotton under glass, the third or fourth year, and some of it is now bearing; but it can not be introduced into the South successfully because we can't get seed from it—it never will bear.

Q. Is there any opportunity to extend the cultivation of the sea-island cotton?—A. Yes; there is abundant room for spreading it. The only question is that the sea-island cotton is decidedly objectionable to an upland-cotton man, for this reason: It is extremely difficult to pick; it grows very tall, and the yield of lint is rarely ever more than 20 to 24 per cent of the gross cotton picked. It is difficult to grow areas of it, unless you have hands that are accustomed to growing it. For instance, if I were to turn you loose in a sea-island cotton field to-morrow I do not think you would earn your salt in picking. I can't. Now, if a man has been taught to pick our cotton, *Gossypium herbaceum*, and he is put to picking the long-lint cotton, he can't do anything. The long-lint cotton has only 3 lobes, while ours has 4 and sometimes 5, and it has a small lump in each lobe; the boll is small, and when he goes to pick it it has horns projecting out, so that he gets them in his hands, and he soon tires of it, and a good picker of upland cotton will be a very slow picker of sea island. We have got to have a roller gin to gin long-staple cotton, whereas we gin all short-staple cotton with a saw gin. Our saw gins are extremely rapid, and you can multiply the saws indefinitely almost. We have now a hundred saws in one gin, whereas the roller gin is very slow in its operation, and the machines are never much longer than 30 or 36 inches. The way we gin quantities of it is to multiply the machinery. The saw gin takes the seed off by means of tearing—breaks the fiber, as it were—while the roller gin or knife gin cuts it clean right from the seed and does not destroy the fiber at all. To pass from the upland cotton to the sea-island cotton is almost as great a transformation as going from cotton to cane. You have to reconstruct your entire labor and machinery.

Q. (By Mr. CLARKE.) If there were a roller gin of as high speed as the saw gin and the same capacity, would that work a revolution in the business there in favor of long-staple cotton?—A. It would help to some extent, but I do not know about the revolution, for this reason: The roller gin is very easy to run and does not require very large horsepower; we run ours with 2 horsepower, and can multiply them very easily. The main feature about the sea island is that its product is less per acre and there is an increased cost to get it. It is nothing unusual for us to make a 500-pound bale of upland cotton to the acre; we rarely ever get that from the sea island. It is something extraordinary if we do.

Q. (By Mr. A. L. HARRIS.) Would the difference in price compensate for cost of production?—A. Yes; the price is very much different. We send all of our sea-island cotton to Charleston and Savannah. They are the markets. There is no sale for it in the other Southern cities. Year before last and last year we shipped out a crop from the lower station over to Charleston, and the prices obtained were from 17 to 30 cents, while the prices quoted went from about 14 to 50 cents.

Another thing about the long staple: It is extremely difficult to hold up the long staple. Those men who get 50 cents a pound for it select their seed with the greatest care and maintain that selection every year; but where they grow it carelessly, as they do in southern Georgia on the plantations, they rarely get over 15 to 18 cents a pound. It is the length that sells it, and the length deteriorates very rapidly under careless cultivation.

Q. When you name these prices, does that mean the cotton ginned?—A. Yes. I should also say that the baling is different. We bale the upland cotton in the press at the ginhouse. The other is put in bags—long bags like you ship wool in—and we pack the bags down by tramping and make them weigh from 300 to 400 pounds, whereas the regular short staple will weigh from 400 to 500 and 600 pounds.

Q. Is the Lowry bale or some other circular bale becoming popular in the South?—A. They are all popular except in one particular. They have only been permitted to be used under what is called a royalty up to date. I understand they are now for sale, or will be next season. Everybody recognizes the merits of the round bale. It dispenses with the enormous amount of bagging and ties that are needed. It condenses and prevents the increased cost for the press at the shipping point, and has many other advantages. Up to date we have had to pay \$1 a bale royalty besides other expenses connected with it. In other words, if we use the machine we put it up, and then on every bale we pack we pay the owners \$1 a bale besides almost paying rent for it in addition.

Q. Can you get any higher price for the cotton baled in that way?—A. I can not say that we get it on the market, but I suppose we could, because you know

that whenever a bale of cotton is sold, whether it is apparent or not, 80 pounds is discounted in every bale of raw cotton, though we are not aware of it generally in this country. A man goes to sell his cotton and he will not be apprised by his merchant; but in England, where all our cotton finds a market, just as soon as it gets there 6 per cent is thrown off as tare. Liverpool telegraphs back the price, and then our local merchants rearrange it so as to cover the whole bale here, but we lose 80 pounds. Therefore we can afford to that extent to pay more for the other, where we only lose about 2 pounds, or 24, per bale, of cotton in sack.

Q. Is there any saving in insurance upon it?—A. Yes; there is a saving in insurance and a saving in compressing. Our big bales have to be compressed at 50 cents a bale. I do not know whether the insurance companies have adopted new rates recently, but it has been shown that these condensed round bales are not inflammable; you can not burn them. I have been present at 2 or 3 tests where they have poured kerosene oil all over them and set fire to a bale, and they have just charred; you can not burn them. If they are tightly compressed, they will not burn.

Q. Is the fiber in any way injured by that pressure?—A. I am told not. Mr. Atkinson writes me word from Boston that by the recent introduction of a machine by which you can take the cotton and unroll it from 5 or 6 bales at the same time and feed it to the spindles or to the pickers the process has become quite popular. Before that it was unpopular, because there was some difficulty in unrolling the bale. Formerly the old, big bale was simply uncovered and drawn out and picked and thrown right into the pickers. Now, this other is unwound very nicely—the round bale, not the Lowry. The Lowry is a spiral bale; the American bale is a round one, and the Lowry is wound in a spiral this way [indicating], and when it is rolled up you stretch the fiber.

Q. Which of these round bales is preferred by the Southern planters, as a rule?—A. No preference has been expressed. There are half a dozen or more now. The only question at issue was which was the greatest monopoly and which was going to squeeze us most. There has been an antagonism developed against these round bales by the large amount of money that we have invested in public gins and public compresses; they have formed a solid front to fight them.

Q. Are the gins and compresses owned by the parishes or counties?—A. No; they are owned by corporations and individuals.

Q. You speak of them as public, then, only in the sense that they serve the public generally?—A. In the hill country, at every crossroads, 2 or 3 miles apart, there is a gin. It is a large establishment, and will probably take the crop of 30 or 40 small farmers. That is what we call a public gin.

(Testimony closed.)

WASHINGTON, D. C., February 7, 1901.

TESTIMONY OF MR. BRYNJOLF PROM.

The commission met at 10.47 a. m., Mr. Farquhar presiding. At that time Mr. Brynjolf Prom, banker and farmer, Milton, N. Dak., was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Please give your name, post-office address, and occupation.—A. Brynjolf Prom; Milton, N. Dak.; I am engaged in farming and banking.

Q. (By Mr. A. L. HARRIS.) How long have you been engaged in the business of banking?—A. Sixteen years.

Q. How long have you been engaged in farming?—A. Nine years.

Q. How extensively are you engaged in farming?—A. I own and farm 7 quarter sections of land.

Q. Do you reside on your farm?—A. No; I reside in Milton. It is only three-quarters of a mile from the farm.

Q. On what plan do you conduct your farming?—A. I rent it; have tenants on it.

Q. Cash rent or grain rent?—A. Shares.

Q. What are the terms?—A. I furnish the seed and pay half of the expenses—that means twine and thrashing—and receive one-half of the grain.

Q. Delivered where?—A. On the farm. The tenant receives the other half.

Q. How general is that plan of renting in your State?—A. In our State those are the general terms, only generally the owner of the land does not pay one-half

of the thrashing. Sometimes we thrash from the shock and sometimes from the stack. It is cheaper to thrash from the stack.

Q. Who furnishes the machine?—A. The tenant. He does all the work and furnishes the machinery and the horses.

Q. How large a proportion of the grain raising in your State is done by crop-sharing?—A. A very small portion. The land is mainly owned by actual settlers and farmers.

Q. Then who does the work?—A. They do it themselves.

Q. Any hired labor in the State?—A. During harvest there is some hired labor, transient, coming in. We need extra help during farming and harvest.

Q. The balance of the season the work is done by the owners?—A. By the farmers; yes.

Q. Are the tenants usually men of families?—A. Yes; middle-aged men with families of children; they are preferred.

Q. Are their children educated on the farm?—A. Yes.

Q. Do the young men continue on the farm when they get to doing for themselves?—A. As a rule.

Q. Are they disposed to seek other employment?—A. No; in our neighborhood they do not seek other employment.

Q. What are the hours of labor?—A. Generally from sunrise to sunset. The season is so short they have to use the whole day.

Q. What are the number of days usually employed in the course of a year?—A. We do no farm labor during the months of January, February, and March. Our labor starts in April, and the labor is then continued through until November, when the grain hauling begins.

Q. Do you pay by the month?—A. Yes, by the month.

Q. What becomes of the labor during the winter months?—A. They rest on the farm. They generally stay there. Our population is largely Canadians. Some use the money they have earned to go home on and visit relatives in Canada. The others remain on the farm.

Q. What are the average wages?—A. The average would probably be \$22 per month; that is, during the fall; \$22 and board.

Q. What is the average during harvest or busy season?—A. During the harvest the rate fluctuates very much. They pay up to \$30 a month, but very often we are not able to hire men by the month in harvest; we have to pay by the day, paying from \$2 to \$2.50 cash.

Q. Have you any such thing as payment in kind or out of the crop?—A. No; all cash.

Q. What is the condition of your tenant houses on the farm?—A. They are fair; they are not great buildings, but they are comfortable.

Q. How do they compare with the average farmer's house?—A. They do not look well; they are small; but they are generally warm. They are generally frame structures, protected by sod—that is, where the farmers are not in good circumstances—but they are good buildings; they are exceedingly comfortable, especially during the winter. They are also cool during the summer.

Q. About how many rooms usually?—A. Two.

Q. Who furnishes the fuel?—A. The tenant.

Q. What is your fuel?—A. Wood, and now in North Dakota lignite coal.

Q. (By Mr. FARQUHAR.) Are the tenants free to go into the woods and supply themselves with fuel?—A. No; they pay for it—for grown poplar wood, \$4 a cord; oak, \$5.50. Hard maple and such stuff we haven't got. Maple would probably cost \$8 a cord.

Q. (Mr. A. L. HARRIS.) Do you burn straw?—A. Yes; flax straw. There are sheet-iron drums made, and they fill these with flax straw packed as hard as they can. This drum is opened at the bottom, and they put it on top of a cook stove, take the lid off and light the fire, and that makes a good fire; it heats the house; it heats one room very comfortably, and lasts a long time. There is a very disagreeable odor with it, but it does first rate for fuel for heating. It is a great saving for farmers who are 15 to 20 miles from timber.

Q. (By Mr. FARQUHAR.) Do you utilize flax straw in any other way?—A. For feeding.

Q. How does it compare with the general feed?—A. My stock this winter was fed on flax straw, and came out fine. I suppose that probably the thrashing was not properly done.

Q. (By Mr. A. L. HARRIS.) Of what nationality are your farmers?—A. Our population is mainly made up of Scandinavians and Canadians. There are also some French.

Q. (By Mr. FARQUHAR.) French Canadians?—A. Yes; and half-breeds.

Q. (By Mr. A. L. HARRIS.) Are they desirable citizens?—A. All except where the French colonize, gather together in villages; where they mix with half-breeds they are not desirable.

Q. Do they colonize to preserve their own customs and language?—A. Yes. There is especially one village north of Milton by the name of Olga. It is an Arcadian village. They preserve their customs and speak French exclusively; they have French priests.

Q. Are their schoolbooks in French?—A. Yes. They are not supposed to be.

Q. What has been the effect of your different nationalities upon the agricultural industry of the country?—A. No marked effect. They all seem to work in the same way, and they work well together; that is, the Scandinavians and Canadians.

Q. Have they aided in developing the country?—A. Yes; materially.

Q. Are they generally industrious?—A. Yes; very.

Q. What nationality predominates?—A. In that neighborhood, Scandinavians. In speaking of Scandinavians I mean the Norwegians mainly; the Swedes are not so numerous there; mostly Norwegians.

Q. (By Mr. FARQUHAR.) Which nationality came in first?—A. The Norwegians came in first.

Q. Which one next?—A. The Icelanders came first in that neighborhood, then the Norwegians and Canadians.

Q. What is the proportion of Americans that settled in there on the farms?—A. Why, it is hardly noticeable. We had to hunt through that country to find an American born.

Q. You speak of Canadians being migratory; that is, you say they work during the working seasons, and then go to Canada on a visit?—A. Yes; they spend the winter months in Canada. They get cheap excursion rates and take advantage of them and go back to visit.

Q. What point of Canada does the supply come from?—A. Ontario.

Q. Have you any settlements of Canadians working in your fields from Winnipeg and Assiniboia?—A. No, seemingly not. That country, the Assiniboian district, is not developed very much itself.

Q. Have they not their own workers to develop their own land?—A. Yes.

Q. (By Mr. LITCHMAN.) What proportion of that migratory population is there?—A. It is not a very large proportion. It is mainly composed of young people.

Q. Is it 10 per cent?—A. No, I do not believe it would reach 10 per cent; but they are young unmarried men.

Q. When they first came?—A. Yes.

Q. When they marry they usually remain in the States?—A. They settle down when they can afford to do so.

Q. And become citizens of the United States?—A. Yes.

Q. (By Mr. A. L. HARRIS.) Were there any special inducements at any time by railroad corporations or others to bring the immigrants to your State?—A. There has been to the western part of the State, I think, but not to our country.

Q. How did they generally acquire their titles?—A. Under the homestead law, and in early years by the preemption and by timber claims. There are many men up there that had three rights, and thus got three claims adjoining, and they have valuable farms.

Q. What do you know about the inducements for settling where the railroads had large grants of land?—A. That would be farther west, on the Northern Pacific.

Q. What is the price of land?—A. At present the price will range from \$12 to \$15 an acre. That is a great increase from only 3 or 4 years ago.

Q. (By Mr. CLARKE.) You speak of that as an average price through your State?—A. Not through the State, through my section of the country—in Cavalier County.

Q. That is higher than the average of the State, is it not?—A. The average of the State will be lowered considerably by the price of Western land, but for the district along the Red River Valley it is not as high as ours.

Q. (By Mr. FARQUHAR.) Of course, you are speaking of improved lands?—A. Yes; there is no wild land any more; no more vacant land; it is all taken up.

Q. Did the settlers maintain possession of their lands and cultivate them, or did they preempt to sell?—A. They preempted to sell mainly.

Q. Into whose hands did these purchases go usually?—A. They piled up mortgages on farms and took the money, and the lands went to the loan companies. They have resold now.

Q. Then the loan companies took the renting rates when they sold them, didn't they, for income? They sold at renting rates so as to get the money back with interest?—A. Yes.

Q. (By Mr. A. L. HARRIS.) Have you many mortgaged farms?—A. Yes; the greatest number of farms in our country are mortgaged.

Q. Are they heavily mortgaged?—A. No.

Q. Are they being paid off?—A. Yes; but many that can pay off will not pay off. They prefer to keep a mortgage on the farm and keep the money to buy extra land.

Q. What is the average rate of interest?—A. On farm mortgages, 8 per cent.

Q. (By Mr. FARQUHAR.) Were not there a great many mortgages made there to acquire more land?—A. Yes.

Q. That is why they maintain them?—A. To a large extent.

Q. The 8 per cent interest they pay enables them to hold the land, and they are able to pay the interest?—A. Yes.

Q. And they make a little money on the crops they raise?—A. Yes.

Q. (By Mr. A. L. HARRIS.) Was that wise or unwise?—A. Wise.

Q. You do not look upon the fact that you have a great number of mortgages as being an argument in favor of adversity?—A. No, sir.

Q. Did it aid your country in developing?—A. Yes. There is no money produced out there except by crops; that is too slow.

Q. Could you have developed upon a cash basis?—A. No, we could not. Our country would not be settled to-day. Most of our farms are bought on a credit. We deem it wise to buy on credit. We can buy lands on crop payments, or we can buy for so many thousand bushels of wheat, and it is no hardship to the farmer. A man can buy a farm, for instance, on the crop payment. Say the price is \$2,000, and he binds himself in the contract to pay one-half of the grain he raises every year. Now, an honest man will do that. All he has to do is to deliver his half and retain the other half for seed and expenses, and he can do it in that way. He can gradually pay for the farm. That he can do in connection with another farm he owns. A man can buy more land that way, and it is an excellent plan.

Q. When he gets out of debt in that way what does he do?—A. Buys more land. They are restless people up there; they can not lie still.

Q. Are your public-school facilities good?—A. They are very good.

Q. Are your schools well attended?—A. Yes, sir.

Q. Can you give us the average per cent enrolled?—A. No, I can not do that; but our State is populated by young people, only young married people, and there are not very many children of school age. It is seldom you see a gray-haired man up in our State. We have few grandfathers. We need them.

Q. (By Mr. A. L. HARRIS.) Is your course of study sufficient for the agriculturists, needs?—A. Not in the public schools, of course; but we have an agricultural college in Fargo, where the more advanced scholars can go to learn.

Q. When was that agricultural college established?—A. About 6 years ago.

Q. That is the college grant?—A. Yes; United States grant.

Q. Has the college an agricultural course?—A. Yes; and it does much good in the State.

Q. Are classics taught there?—A. I think so; but the greatest benefit that our farmers derive is from the professors of the agricultural college making tours throughout the State and holding institutes during the winter months, when the farmers are not busy and can go down and attend and learn how to cultivate farms and get the best results of the experiments of the college.

Q. Please describe the workings of one or those institutes.—A. We had one in Milton in December. Three professors from the college came up there and lectured on the handling of the soil, giving us their results in experiments on farms. They had grown wheat for so many years in succession and gave us the result of the last year. They took another plot of ground that had been planted to corn, and in that way they gave the results of the different ways of feeding the soil, where manured and where not manured, and it is of great benefit to the farmers. We also had an institute the year before. That was the first institute there, after we had a tremendous dry year in North Dakota, and those farmers went there to get the benefit of instruction from the professors who had raised a crop during the dry year, while the others did not.

Q. Do you have any local talent to take part?—A. Yes; we make it as attractive as possible for the farmers, give a little entertainment, and make it all as inviting as possible.

Q. Are your institutes well attended?—A. Very well attended.

Q. At how many points in your country do you hold institutes in the year?—A. It depends upon how great the demand is from the other parts of the State. We have only two points in our county.

Q. That is once a year?—A. Yes; just during the winter months. But in con-

nection with this I wish to state that the president of the Great Northern Railroad, Mr. J. J. Hill, during the summer sends a train up through our country and invites the farmers to ride over to Fargo to the agricultural college to visit it and learn what they can during that time, and brings them back again, without any charge.

Q. Is that privilege taken advantage of by the farmers?—A. Very much; farmers press for the chance to go.

Q. Good results?—A. Yes; they get the best results.

Q. Have you an experiment station in your State?—A. There is one connected with the agricultural college.

Q. Is that doing good work?—A. Yes.

Q. Do they conduct experiments along practical lines?—A. Yes.

Q. How is that knowledge distributed?—A. Through bulletins, which we can get by sending for them; also, the professors give results. They have large tables, and they hang them up on the walls of the institutes, so that we can see the results for ourselves. They work in our interest, and we can ask questions and get information.

Q. Do your experiment-station men attend your institute meetings?—A. Yes; they are the professors that conduct them.

Q. You feel that there is a growing interest in the education of the farmer in your State?—A. Yes; there is. Our farm boys are getting a better education.

Q. Does that improvement have a tendency to keep the boys on the farm?—A. I think it has.

Q. Does it have the tendency to remove the drudgery of farm work?—A. It has a tendency to make it more interesting. Instead of looking at and seeing nothing, they see something.

Q. As a result your farmers are more sociable, are they, and have more extensive acquaintance among themselves?—A. Oh, yes.

Q. What are the earnings of capital invested in agriculture compared with investments in other business in your State?—A. I think agriculture is way above any business enterprise we conduct in our State.

Q. How does it compare with banking?—A. First rate, although banking pays pretty well up there. Our banks pay 20 per cent dividend; but my farm pays better than that.

Q. How does the investment in farming compare with manufacturing investments?—A. We have no manufacturing plants.

Q. Have you anything to suggest in regard to taxation?—A. No; our taxes are just in the State.

Q. How is your property valued for taxation?—A. By an assessor. He values it, and then a levy is made to meet the expenses of the different counties.

Q. You tax upon an actual value basis of your property?—A. Upon what is supposed to be actual value. It is upon the assessed value, which is a great deal below the actual value.

Q. Does the farmer have any advantage or disadvantage by that system of valuation?—A. No; he does not seem to have any advantage, nor are there any disadvantages. The farmers are fairly treated.

Q. Have you any suggestions to make as to amendments to your tax laws?—A. I have not.

Q. Is your soil declining in its productive qualities?—A. No; not if it is taken care of, and it is being taken care of. There are farms that have been sowed to wheat for 15 years in succession. Of course, that is hard on land; but the last year's production was a wonderfully big crop. That is not proper treatment, but it shows a tremendous strength and richness of our soil.

Q. What is the character of your soil?—A. It is black, heavy, clay loam, a rich black loam; it is about 24 inches deep on an average upon a clay subsoil.

Q. Does it respond favorably to fertilizing or rest?—A. Yes.

Q. Is it easily brought up when run down?—A. Yes. The only way we rest it is to summer fallow it, lay it over 1 year, and let weeds grow, then turn them down during the month of July before they go to seed.

Q. Do you raise clover?—A. No.

Q. What are your chief products?—A. Wheat, flax, oats, and barley.

Q. What is the nature of the country?—A. Open territory.

Q. Have you any oak there at all?—A. Some, but not a great deal.

Q. (By Mr. A. L. HARRIS.) Have you any bonanza farming in the State?—A. There was some in the northern part of the State.

Q. What is the effect of bonanza farming upon the farmer?—A. It is not good.

Q. Will you state why?—A. The bonanza farmers do not patronize the villages. They ship in all goods from the East. They act as a wholesale grocery house for themselves, and it is probably a drawback for the other small farmers in the way

of school privileges. The bonanza farms are very large. They divide them up into different parts, with a foreman for each part. They have a little village of their own.

Q. Is the bonanza farm generally conducted by hired help?—A. Yes.

Q. Single men?—A. Mainly, yes; only the foreman is married.

Q. What school facilities have they?—A. On these large farms there are none. Of course, they do not need them, but if there are small farms wedged in between their occupants suffer.

Q. Those large farms are conducted upon strictly business principles?—A. Strictly business principles, nothing else.

Q. Are they farmed upon more scientific principles?—A. The farming there is done more scientifically than on the small farms.

Q. Is it done more economically than on the small farm?—A. I think so; yes.

Q. The percentage of profit, then, is larger on the bonanza farm, is it?—A. In proportion; yes.

Q. What are the general results?—A. The general results to the people of the country at large are not good, and the people generally would favor the abolishment of bonanza farming.

Q. (By Mr. FARQUHAR.) The bonanza farming is simply to get the product out of the soil and ship it East?—A. Yes.

Q. (By Mr. A. L. HARRIS.) Have you any organization among your farmers?—A. There is none now. There was one once which was called the Farmers' Alliance. It was originally started for the purpose of discussing agriculture for the benefit of farmers, but it turned into a political association and went to pieces.

Q. Has it any strength now?—A. None whatever.

Q. Have you any farmers' clubs?—A. There are none, excepting a "Farmers' Institute Association."

Q. To what extent do you diversify in your farming?—A. We are just in the beginning of the period of diversified farming in our county. We have been exclusively grain growers, of wheat mainly. Now we are turning into flax, and the more advanced farmers are raising a great deal of stock. The stock they kept there before for meat purposes was scrub stock, and was very unprofitable, but now they are going into blooded stock to see if that pays, and it is being taken hold of largely.

Q. What kind of stock is raised generally?—A. Shorthorn cattle.

Q. Do they do well?—A. Quite well.

Q. How much of the year do you feed?—A. We have to feed nearly 5 months, but we can feed on straw. The cattle eat up all the straw which formerly was burned just as soon as thrashed.

Q. Do you raise horses?—A. Yes, each farmer tries to supply himself with horses, but we do not raise them for export. They import a few horses every year. That is mainly because our country is just being settled; the western part of it is just being filled up.

Q. Where did the original breed of horses come from?—A. We got them from South Dakota, Minnesota and Iowa. Most dealers go down there and get them and ship them up.

Q. Is the trade profitable?—A. It is very profitable to the horse dealers.

Q. Do you raise any sheep?—A. The sheep industry is not flourishing now. It was at one time.

Q. What is the cause of the decline?—A. When wool went down to 5 or 6 cents a pound, it was not profitable. Since that the business has been taken up again.

Q. No disability, then, so far as the climate is concerned?—A. No; the climate is favorable to sheep raising—very favorable; it is cool and crisp up there, and the wool grows long, but wheat raising is easier than stock raising, especially as the water question enters into the stock-raising question. The farmers who have no rivers and lakes have to rely on wells, and they can not rely on them when they have a large amount of stock. That is one of the main reasons why we have not raised stock extensively. We have no artesian wells.

Q. Is there any disposition to return to sheep raising?—A. The few men that have sheep say they receive great profit on them.

Q. Is the profit alone in the wool or partly in the mutton, sheep, lambs, etc.?—A. In the wool alone is more profit, and it increases, of course, very rapidly.

Q. You spoke about burning flax straw. Is there any other use that you put this straw to except burning?—A. Feeding.

Q. You do not manufacture it?—A. No; we have no manufacturing plants.

Q. Has any attempt been made to manufacture it?—A. Yes; there is now in Fargo a flax mill where the straw is thrown in and it is run over rollers, and the wooden part of it is taken out so that the fiber is left. These fibers they press into hard blocks and ship them East for linen manufacture.

Q. Is that profitable?—A. They say it is very profitable. It is very profitable to the farmers living close to the mill.

Q. What do you do with the flaxseed?—A. Ship it to Minneapolis.

Q. What price does it command?—A. Last year the average price, I should think, would be from \$1.40 to \$1.50 a bushel.

Q. How many bushels to the acre do you raise?—A. Last year the production varied from 8 to 9 bushels to 24 bushels. The average yield of flax is from 14 to 16 bushels.

Q. Is that a profitable crop to raise?—A. Excellent.

Q. Is it hard on the soil?—A. We do not think so if the land is properly treated. If you do not sow to flax continually, it is not hard on the soil, or where they rotate the crops it is not hard.

Q. (By Mr. CLARKE.) The flax is grown entirely for seed, I suppose?—A. Entirely for seed.

Q. (By Mr. LITCHMAN.) The straw is a by-product?—A. Yes; that is by-product; it is simply a chance the farmer has.

Q. If he averages 16 bushels to the acre for his flax at \$1.50 a bushel, his straw would be an extra income?—A. Yes.

Q. What would the average be if the average production was, say, 16 bushels; what would be the value of the straw?—A. I think they get \$2 a ton for the straw.

Q. How many tons would it average?—A. Probably 2 tons to the acre.

Q. The rent of your tenants on your farm is made from the half share of the product of wheat?—A. Of all grains.

Q. If the farmer raised a diversified crop, the half share would apply to that?—A. Yes.

Q. He must get his living out of the half share he retains?—A. Yes.

Q. And would the half share apply to the garden crop that he raises for his own living?—A. No; he gets a certain part of the field for his own exclusive use for garden stuff, potatoes, etc.

Q. (By Mr. A. L. HARRIS.) What effect has improved machinery had upon farming?—A. It has had a great effect. It has had the effect to facilitate the raising of crops.

Q. (By Mr. FARQUHAR.) How successful are you growing corn and ripening it up there?—A. Corn is creeping up on us; we are beginning to raise corn up there, and are maturing it. Cavalier County lies on a plateau, about 400 or 500 feet above the bottom of the Red River Valley. The altitude shortens the season a little up there. We are a little later in the spring and a little earlier in the fall, and the corn on top of the hill, as we call it, does not mature, but we are confident that it will not be very many years before we can mature it, because our seasons are longer than they were when we started. The cultivation of the soil farther West, the breaking up of the whole vast territory West of us, gives us more heat.

Q. What is the influence of the west and northwest winds?—A. The Chinook winds do not reach us.

Q. Do you get the southwest wind?—A. Yes.

Q. That is all land wind?—A. Yes; but we have no hot, burning winds. They don't strike us. Those hot winds that strike South Dakota do not reach us.

Q. (By Mr. A. L. HARRIS.) Has farm machinery to some extent compensated for the decline in the price of wheat?—A. Oh, yes.

Q. What is the average price you get for wheat now?—A. There are different grades of wheat. During the last 6 years the average grade of our wheat has been No. 2, and the average price during the 6 years has been 55 cents for that grade of wheat.

Q. How many bushels do you raise to the acre?—A. In 1895 we had a big crop, but last year we had a small crop. In the intervening time we had average years, and the average yield has been 14½ to 15 bushels to the acre.

Q. What is the cost of production of an acre of wheat?—A. It costs about \$5.72 an acre.

Q. That includes interest on the land?—A. No; not interest. It is the cost of production—of all labor, seed, hauling, and all things pertaining to the work and marketing the wheat, but not interest on the investment.

Q. Then you have a margin of profit?—A. Yes.

Q. What have you to say, if anything, in regard to the extension of foreign markets?—A. We are very desirous of having an extension of the markets up our way.

Q. In what direction are you looking?—A. West. We are hoping that the ship subsidy bill will pass so as to get aid from the western shipping. We think that will help us greatly.

Q. (By Mr. LITCHMAN.) How far is that opinion shared by your associates

among the farmers?—A. The farmers that know of the bill generally share the opinion, but there are many farmers who have no idea what it means.

Q. Are you so situated as to be able to get the opinion of the thinking men among the farmers, the leaders of the farmers?—A. Yes, sir.

Q. Do you believe their sentiment is that the subsidy bill would be a good thing for the development of foreign trade?—A. Yes. All the farmers there know that the development of foreign trade will help their cause, but they would not lay it absolutely to the passing of the subsidy bill.

Q. Do they look upon the passage of the subsidy bill as an instrument in that direction?—A. Yes.

Q. (By Mr. CLARKE.) Would not the development of the home market help it also?—A. No. We have no home market. The North Dakota farmer can not sell his grain in North Dakota. That is the great trouble with us.

Q. Suppose the population of all your towns should increase several fold, and that of the large Western cities also, so as to have more consumers; would not that increase help the market?—A. It would help to a certain extent, but hardly the grain market so much. It would aid the farmer in diversifying his crop, in raising chickens, garden truck, sheep, and stock. I do not think it would tend to increase the price of the grain. But we can not look for any increase in that way except by establishing manufacturing plants.

Q. You are aware, are you not, that here has been a steady increase in manufacturing throughout all of the Western States?—A. Yes.

Q. Do you not anticipate something of that experience in your own State?—A. I do not anticipate. We hope that such a thing will happen, but we do not see how it can, because we find that all manufacturing plants go to places where fuel is cheapest and where power is cheapest, and there is none of either in our State. We have no water power there. We can not manufacture electricity cheaply, and so we are shut out.

Q. So long as farming pays 20 per cent or more per annum, do you think it is an object for anybody to be engaged in manufacturing?—A. No; we do not think it pays the farmer to leave his farm to go into anything else, and our farmers up there do not think so, either. They stick closely to the farm. Our farmers who came there in 1882 and 1883 (they were the best years) are as independent as any rich man living here; that is, according to their means. They do not want all the luxuries, but they are progressing.

Q. In your opinion would a man engaged in manufacturing in Chicago consume more of the Dakota farm products than a man engaged in manufacturing in London?—A. I think so, from what I have seen myself. I have been through Europe, and have been very much among the laboring class there, and from the way they are fed I am quite sure the American laborer lives better.

Q. Besides the mere matter of living better, is it not true that the London workman would draw his agricultural supplies from several countries, while the Chicago workman would draw his almost exclusively from his own country?—A. Yes.

Q. (By Mr. A. L. HARRIS.) What is the condition of your roads and highways?—A. They are fair; not been very good, but they are improving right along.

Q. Have you good material for making roads?—A. Not the very best. We only have the clay of the ground; but if the roadbed is properly built it makes a very good road.

Q. How many months are the roads good?—A. All the year round. They are dry in summer and frozen hard in winter, if properly constructed.

Q. Is there much interest in the good-roads question?—A. Yes; that has just been awakened.

Q. Is that one of the subjects discussed in your institute meetings?—A. Yes; attention is always called to it.

Q. Is the price of farm products, especially wheat, affected by dealing in options and futures, "puts and calls"?—A. As a farmer, producing the actual grain, I think that it does us harm to have gambling in wind. It will sometimes increase the visible supply artificially and therefore lower the price where the supply does not exist.

Q. Does the "future" sale have an effect upon the spot sale?—A. Not the future sale of actually delivered wheat.

Q. Are future sales usually based upon actual delivery?—A. They are not. Those sales and purchases are made by men who never saw wheat and who have no wheat to sell.

Q. Do you think that practice should be prevented by legislation?—A. I think it would be better for the farming community if that practice were prevented by some method.

Q. Have you any remedy to suggest?—A. I have not. There are laws forbidding gambling, but I do not think it would come under the head of gambling. If they did, it would help.

Q. How many railroads have you in your county?—A. Just one—the Great Northern.

Q. Has there been any reduction in rates in the last few years on that road?—A. Yes. The freight rate, I think, was reduced 2 cents a hundred pounds during the last 3 years, which was a very welcome thing to the farmers.

Q. (By Mr. CLARKE.) Between what points?—A. All through the State.

Q. (By Mr. FARQUHAR.) Was that a voluntary reduction?—A. That was a voluntary reduction by the railroad.

Q. (By Mr. A. L. HARRIS.) Does that road give you good shipping facilities?—A. It gives us good shipping facilities except during the main shipping season in the fall of the year. We have no competing elevator companies. Outside of grain shipping in the fall months we have good facilities; we can get a stock car at any time.

Q. What is your terminal point or points?—A. Minneapolis and Duluth are the only points.

Q. How many elevators have you in your town?—A. We have 10 in my town, all "line" elevators.

Q. Are they all owned by the same persons?—A. Seemingly not. They are different corporations. There might be the same stockholders, though, in the different companies.

Q. Can you name the corporations that own them?—A. I can give the names, yes—the Northwestern Elevator Company, the Duluth Elevator Company, the Minneapolis and Northern Elevator Company, the St. Anthony and Dakota, and the Imperial Elevator Company.

Q. Where do your shipments go, mostly?—A. They are very evenly divided between Minneapolis and Duluth. The freight rate is the same to both points.

Q. What are the freight rates from your town?—A. Fifteen and one-half cents per 100 pounds.

Q. How is the price of grain regulated?—A. The price of grain is telephoned up every day to the agent at one of the elevators, and he is supposed, at once, when he gets the price, to go to all the other agents and give it to them.

Q. Where does that message come from?—A. It comes from Fargo, and Fargo receives it from Minneapolis.

Q. (By Mr. KENNEDY.) Does Minneapolis receive it from Chicago?—A. No.

Q. (By Mr. A. L. HARRIS.) Do you receive any price from Duluth?—A. No.

Q. From no other point except Minneapolis?—A. None.

Q. Is there any combine in Minneapolis that you know of that controls the card price of grain?—A. All the elevator companies in Minneapolis, the line elevator companies, have given it into the hands of one man to fix the prices. That one man determines what the prices are to be from the market of the day. He goes on the floor of the exchange; he is the master; he determines what is right to do, whether they shall reduce the price or raise it. If the price is raised, if the price goes up that day, he generally writes a line up to the man in our town and tells him to raise the price; but if the price goes down, he wires at once.

Q. What does he take into consideration when he raises or lowers the prices?—A. The actual market quotations on the floor of the exchange. He is governed by them.

Q. Are they governed by the quotations of any exterior point?—A. Only by inference. Any reports from the Argentine Republic, the condition of the weather, possible wars in Europe, and rain in the Northwest during the dry season, all have an influence. He has to consider all these causes and be the sole judge whether the price ought to go up or down.

Q. It really, then, is an arbitrary fixing of the price upon apparent conditions?—A. In reality that is what it is.

Q. Have you any independent elevators along the line of your road anywhere near you?—A. No; not near us. No independent elevators.

Q. If the price is given out at Milton and you do not feel like accepting it, what do you do?—A. Keep our wheat. Either that or try to get a car and ship it to Minneapolis or Duluth to a commission firm.

Q. Will the railroad officials furnish you a car promptly?—A. They will if they can not help it; but they are not very eager to furnish cars to private shippers.

Q. Do the line elevators in your town get cars in preference to the independent man?—A. Yes. The way we have to order our cars makes it nearly impossible for us to get a car. When there was very little wheat during the dry season like last year, there was an abundance of cars, and the railroad company was anxious to do some business. Then we could get cars. But during the busy season, when

our crop is abundant, we can not get cars. The rule of the railroad company is that if we want a car we must order at 6 o'clock Saturday afternoon, and the elevator agents must do the same. They are there beforehand; they stand by that little window and put in their orders for, say, five cars—each one so many cars. The farmer can only order one. Now, as the cars come up, the first man that ordered is first served, and all the elevator companies have ordered first and they are first served. Only a limited number of cars are sent up during the week, and if that is not enough to go around the farmer gets none. Then he has got to be there the next Saturday and give an order.

Q. Suppose you get a car and load it with wheat, where do you send it?—A. We send it either to Minneapolis or Duluth to a private commission merchant.

Q. Does he have all the facilities that the elevator men have?—A. Yes, if he is a member of the board of exchange he has; he must be a member of that body.

Q. Does the railroad carry that car as quickly as it does the other?—A. Yes.

Q. And delivers it as promptly?—A. Yes.

Q. And charges the same switching and demurrage rates?—A. Yes.

Q. (By Mr. KENNEDY.) Does that farmer get the same price for his wheat or a greater price than if he had let the line elevator have it?—A. He generally gets a greater price. Of course, he also gets the margin that the elevator companies reserve to themselves for their own business.

Q. (By Mr. FARQUHAR.) Have you ever tried independent shipping yourself?—

A. Yes.

Q. How did it result?—A. Profitably every time.

Q. Profitably. Where did you try, Duluth or Minneapolis?—A. Both points.

Q. What is the difference between the Duluth price and the Minneapolis price?—

A. At times there is 2 cents difference in favor of Duluth, and at other times of the year Minneapolis is higher; it fluctuates. The best grades of wheat go to Duluth; the No. 1 Northern goes there. The poorer grades are generally shipped to Minneapolis. They mix it with the better grades and raise the other grades.

Q. Is the Great Northern Steamship Company a buyer in your section?—A. No.

Q. Are those elevators owned by Mr. Hill's road?—A. No, none; he may have an interest in them.

Q. Have the Milwaukee, Chicago, and New York markets an influence in making the Minneapolis price?—A. They may have, if they are heavy buyers there. There may be a greater demand, and it may raise the price at Minneapolis. Of course, the board of exchange in Minneapolis gets those prices every minute from New York and Chicago.

Q. Have you any Chicago buyers in your section at all?—A. No.

Q. (By Mr. A. L. HARRIS.) Do the line elevators compete with each other?—A. No, seemingly not.

Q. The price at one elevator is the price at all?—A. Yes, and they dare not go above it.

Q. Do your farmers store wheat with these elevators?—A. Yes.

Q. What are the terms of storage?—A. The same storage there as in Minnesota. I think it is 2 cents a bushel for the first month. We have, I think, the first 15 days free. Fifteen days free, and 2 cents a bushel for the first 30 days, and half a cent for each additional 30 days per bushel.

Q. Is there any feeling among your elevator men if one elevator man gets grain and the other elevator man does not?—A. Yes.

Q. Is it harmonious?—A. Not harmonious; no. If one elevator's agent grades a load of wheat a little better than the other elevator agent would have graded it and buys it for a better grade, the other elevator reports the fact to Minneapolis at once, and he is complained of.

Q. What is the result?—A. The result is that the superintendent of that elevator line writes him and gives him an overhauling for not sticking closely to grade.

Q. How is your grading done?—A. Each agent of the elevator jumps up on a load of wheat, takes a handful, and looks at it and says what in his judgment that wheat ought to grade. If the farmer questions the grading, he says, "That is all I can give you," and to verify what he grades it he has a little scale and he weighs it to see whether it comes up to weight.

Q. What you call a tester?—A. Yes; only if it comes up to a certain weight. No. 1 hard; that is the only test he has there.

Q. Suppose the farmer is not satisfied, what then?—A. He goes to another and the new elevator agent will ask him what the other offered him.

Q. Have the elevators telephone connection?—A. No; but they have a very good system of dealing, because their windows are nearly opposite the others, so that you can see.

Q. Are these elevators close together?—A. Yes; there is just enough room between for driveways.

Q. And if the farmer answers truthfully, what is the result?—A. The other fellow does not give him any better; he says, "That is all I can do for you."

Q. If he should remonstrate, what then?—A. Sometimes he makes a better grade.

Q. Does that cause any trouble between the elevator men?—A. Yes; the man that buys at a better grade is reported at once, and the superintendent comes up and overhauls him. I think the main cause, or the greatest difficulty of the farmer is the grading system of the wheat; it is left in the hands of men who are not competent.

Q. When a farmer stores his grain with an elevator company is it all dumped in the same bin or are different grades kept separate?—A. No; they have different bins for different grades, and it is also possible for a farmer to get an independent bin for his own wheat if he desires to ship it. The elevator company will take in my wheat, for instance, and allow me to ship it in a car on my own responsibility and charge me 2 cents for that privilege.

Q. Do you mean that you can draw out the identical grain that you store if there is an agreement?—A. Yes; but if I store without any special agreement I just get what he calls that same grade; I do not get my own identical wheat, and if we differ on grades, I am liable to get an inferior grade.

Q. Have you a law forbidding the mixing of grain at your elevators?—A. I do not believe so. We have no mixing houses, no facilities.

Q. Suppose you are not satisfied with your elevators and desire to build an independent elevator, what facilities have you for doing that?—A. We have to apply to the railroad company for a site and we are very slow in getting it. It is almost impossible to get it. Any facilities for shipping or handling grain independently are very hard to get. It is necessary in order to ship our grain to have a loading platform to drive up to in order to get our wagons on a level with the car floor. The railroad commissioners compelled the railway company to build one, but the commissioners did not designate the place. So the railway company put it away out where it was so steep the farmers could not drive up, and they could not use it, and the railway company built it so "peaked" that the wagon would stand down on one side and the horses down on the other, and it was impossible to use it; so we had to build one and donate it to Jim Hill—make him and his company a present of it. The farmers up there combined to build a farmers' elevator and applied for a site, but they did not get it.

Q. For what reason?—A. They did not get it: the railroad people will not give you reasons; they simply stand you off.

Q. (By Mr. RIPLEY.) Does not the law require it?—A. They do not pay much attention to law up there in that respect. Then you go to the railroad commissioners, and if you have nobody that stands in with them you do not hear anything from them. It has been one of the most difficult things to get a site.

Q. If you make a showing as to the need of an elevator, does the railroad commission turn you down?—A. The railroad commission is supposed to come up and investigate the subject. Their investigations consist of a flying trip on a private car. They stop two minutes at the private station, and if we are there to speak to them they say "Yes; that is all right; we will give it to you;" and on they go, and that is all there is of it. It is practically impossible for us to get anything. Maybe the law is good enough but our administration is not.

Q. Does the presence of five elevators in your town have anything to do with the railroad commission deciding against you?—A. It should not.

Q. On the ground that you have sufficient elevator facilities?—A. No; they are not supposed to give judgment on that point.

Q. Suppose you are turned down by the commission, then what can you do?—A. Nothing but sell our grain to the elevator companies; that is our only way out of the difficulty.

Q. (By Mr. FARQUHAR.) What advantage would it be to you to have an elevator of your own?—A. We would obtain better prices.

Q. That is, by holding for a market, or what?—A. We would not have to take the card price; we would not have to pay the margin that the elevator companies get, which is sometimes too large, especially on the lower grades. They are supposed to do business on a margin of $3\frac{1}{2}$ cents on No. 1 hard, and on the lower grades that they have in Minneapolis the margin is 4 and $4\frac{1}{2}$ cents greater, and it is the lower grade that they buy. The fact is that they never buy a bushel of No. 1 hard wheat in our town. It is out of the question. The wheat has to be an excellent fine quality in order to get No. 1 Northern grading for it.

Q. (By Mr. FARQUHAR.) How clean is your wheat presented for inspection?—A. As it comes from the threshing machine.

Q. Is it uniform?—A. No; it is not from the different farms. It is mainly as it comes in from the farms in loads that it is graded.

Q. Is the inspector supposed to be a man that understands grain?—A. He is a man who has been in the grain business for some years. Of course, one year is his first year, and then he is very green.

Q. Can you state to the commission for yourself what advantage this independent elevator would be?—A. It would create competition. A good honest man would give us a better grade for wheat, and that means 2 and 3 cents a bushel for the farmer. Besides that, he would not buy on that wide margin, and we would make something there, and he would give the farmer what is actually in the wheat—what he should have in the weight. When it is possible for a farmer to get a car he makes from 5 to 10 cents a bushel on his wheat. Now, a private elevator would do that and would help him to get that without waiting for a car. Now they have to hold their wheat in granaries until spring, when cars are plentiful.

Q. So you think it would pay a farmer to take his chances on the Minneapolis and Duluth markets and do his own shipping rather than sell to the line elevator?—A. It would pay him now, yes.

Q. How much margin is the hazard worth as it is?—A. There is no hazard.

Q. None at all on a falling market?—A. No. Of course, as soon as the market falls below it falls at Milton, and they wire up the minute it falls; but if it rises they take time to write about it.

Q. (By Mr. A. L. HARRIS.) The inspector you speak of at your local point at Milton is merely a grain buyer?—A. Yes; that is the man we have to sell it to, a grain buyer.

Q. He is the manager of the elevator?—A. Yes, practically.

Q. Do you know of any independent elevators that have been built along the line of the road?—A. I know one at Lakota.

Q. How far is that from your town?—A. About 70 miles.

Q. Do you know anything about the operation of that elevator?—A. The line elevators decided that it should be killed, and if they could not kill it they would kill the men that went into it. The merchants of Lakota stood behind it to help the farmers, and the old-line elevators started stores in Lakota—general stores handling all the goods that the merchants handled, and sold them at absolute cost as a revenge. The result was that the merchants ceased their support of the independent elevator; they could not stand it.

Q. What became of that elevator?—A. It gave up the business.

Q. (By Mr. FARQUHAR.) Did the line absorb it?—A. No; it stands there yet. I think. A year ago last winter the elevator companies laid it down that on points both above and below us the wheat prices were to be above ours. At Union, a station 6 miles below us, they bought wheat at 2 cents above our price, and they were also paying higher prices at the other station 6 miles west of us. Consequently all our trade went away. Our town was as dead as on a summer's day right in the middle of the busy season. We decided we ought to do something, and we combined and employed a private buyer. We hired men and fixed a place to draw the wheat into and to load. The superintendent came up to see about it, and we told him we would keep it up until they gave us a better grade, and they promised to do so. So they did not buy anything for just about a week. The merchants and all the business men combined to hire these men, pay their expenses, and all that, and they brought about a settlement. The move raised the prices to the standard, to the average where they should be, so that we would be on an equal footing, at least, with the other fellows. But they said: "See here; if you keep this up we will simply wade into your business; we will establish hardware stores and general stores as well as wheat houses." Just as soon as we had started all the agents of these 5 houses reported. The managers and heads of these companies conferred in Minneapolis, and they sent a man up to see us. Now, as a proof that these elevators pool, are all one, a few years ago there was only 1 superintendent sent out to superintend the whole line for all the different houses in our town; there was only 1 man sent as a superintendent. But that was such an evidence that they were pooling that they quit it, and now they send out 1 to each house.

Q. That is a traveling man?—A. Yes; the superintendent.

Q. They keep up a show, then, of being separate?—A. Yes; they would not give themselves away.

Q. Have you ever known the line elevators to have any friction with each other?—A. No; I do not know of any; that has not come under my notice.

Q. At Lakota, where the farmers had an independent elevator, did the line elevators put up the price of grain to freeze out the independent elevator?—A. They generally do that; yes, I think they did that in the beginning; they always do it.

Q. After the independent elevator quits, then what?—A. They lower the price immediately.

Q. Have you any information, based upon reasonable facts, as to what the loss to the farmer is on account of this elevator combine that you speak of?—A. We figure that we generally lose; we lose sometimes 2 grades on wheat. On the lower grades the difference in price is more. I have here a card showing the different grades. No. 1 hard, for instance, sells at 60 cents; No. 1 northern is 59 cents; that is only 1 cent difference. The No. 2 is 55 cents; that is 4 cents difference. That is the only grade we can get, No. 2. While our wheat is good enough under the weight to be No. 1 hard, if one of the kernels is a little wrinkled, or a little dirty in the end, they say, "Look at that, we can not allow for that;" and in that way they lower it. If there is any little irregularity in the kernels they lower the grading. They do not go by grades, they go by actual weight in the kernel. They want it well shaped; if it is not, if it is a little bit off shape, they lower the grade. Now, you see, between No. 1 and No. 2 there is 4 cents difference; if we lose that grade we lose 4 cents a bushel right there. Sometimes we get No. 3 for wheat that we should have No. 1 for; that is another 5 cents. No. 3 is 50 cents. So we sometimes lose from 4 to 9 cents a bushel on our wheat.

Q. Please state whether the farmer and the independent elevator get justice in grading at the terminal point.—A. That also depends upon the ability of the grader; that is an appointive office. The governor of Minnesota has the power to say whether it is to be a man or a dummy that is going to do the grading, and we are absolutely under his thumb in that respect.

Q. Has the independent elevator man any more to say than the line elevator man?—A. No; he does not seem to have.

Q. Do you know of any influence that he may be under?—A. Yes; I know that the men of the large elevator lines can go along the train that brings in their cars and say, "Here, that is all No. 2." They will say to the inspector, "That is all No. 2," and they stand in. But where the inspector is an honest inspector who comes up to the requirements, he will not do so. He will inspect it and put his mark on the car.

Q. When you ship grain to Minneapolis does it go into the terminal elevator?—A. Yes; it does. If I ship a car to a private commission man and he gets the car he will take a sample of it and bring it up on the floor and offer it for sale. If it is No. 1 he calls it No. 1, and then it will bring the standard No. 1 price. If it is good wheat it will sometimes sell for the same price as No. 1 hard. The question is what benefit it is to the farmer to have his grain called No. 2, if he receives No. 1 price on the board; and you never find that the wheat that is graded No. 1 hard at home sells below; it never does. It simply ends with the man that graded that wheat. Of course men who need the wheat and buy wheat and have bought wheat for many years, and know what they need in their business, are willing to pay for No. 1 hard wheat while the inspector says it is all No. 2. So we prefer to ship it and take our chances on the merit of the grain.

Q. (By Mr. FARQUHAR.) In other words, wheat graded as No. 2 at Milton will sell in the Minneapolis market as No. 1 hard?—A. Often; not always, of course; but it has been done.

Q. (By Mr. A. L. HARRIS.) You have no complaint to make as to any rules against the independent shipper at the terminal elevator?—A. No. Of course his grain is all handled by private commission houses.

Q. Is the building that the independent man puts up, if he gets permission to put up one, a costly building?—A. It is not; it does not require a costly building. It is about the same kind of a building that the elevator company puts up with a minimum capacity of 30,000 bushels. That is the requirement, and they would have to have facilities for loading the grain into the houses and weighing it and spotting it into the cars.

Q. Have you a law in your State regulating elevators, storage rates, etc.?—A. No; I do not believe there is any in North Dakota. I think it all comes under the Minnesota regulations, but I am not sure.

Q. Has your railroad commission any power in regard to the appointment of inspectors, and the making of rules and regulations as to storage?—A. No, not the North Dakota railroad commission.

Q. Have you any complaint to make in regard to the practice of storing and mixing grain?—A. No.

Q. (By Mr. CLARKE.) Do you know what profits these elevator companies make?—A. I do not know that I can state any definite profits, except that I know, for instance, that this year 1 car of flax was shipped from our station, and the company's profit on that 1 car of flax, containing 1,000 bushels, was \$450. That shows how much under the market they buy.

Q. Was that profit exceptional, do you think?—A. Yes; that was exceptional.
Q. Owing to some fluctuation in the market?—A. It was not owing to fluctuation in the market: it was owing simply to the way they bought the flax. That was a special feature with them this year.

Q. (By Mr. FARQUHAR.) That was taking advantage of the ignorance of the farmers?—A. Yes. Not only that, but the rules that they laid down for grading flax. There were only 2 grades, No. 1 flax and "rejected" flax.

Q. (By Mr. CLARKE.) Do the farmers at their institutes discuss these questions of the elevator service and the grading?—A. No; simply the agricultural part of it.

Q. Are they discussed among the farmers, then, except in private conversation?—A. No; only in private conversation.

Q. There has been no common action of a political character by the farmers, then, to protect themselves?—A. No.

Q. (By Mr. RIPLEY.) Is it felt by the farmer that the presidents of these railroads are responsible for this action, or do they refer it to the action of other officials in the traffic departments?—A. Oh, they do not complain of the presidents of the railroad companies.

Q. They make a clear distinction between the elevator companies and the railroad companies?—A. Yes.

Q. And they see no evidence that the railroad companies control the elevator companies?—A. No; it is not the general belief among the farmers that the railroad companies control the elevators.

Q. That was formerly the case, was it not?—A. Formerly, I believe it was.

Q. How long since the two have been divorced?—A. I do not know.

Q. (By Mr. A. L. HARRIS.) Do you know whether the elevator companies ever bear the market?—A. I think they have a good deal to do with bearing it.

Q. What evidence have you?—A. I have no evidence, but I am quite sure they do.

Q. Do you know if the same owners own stock in all these elevator companies that you have mentioned?—A. Well, I know that the same men hold stock in different elevator lines.

Q. Do you know whether those same men are also stockholders in the Great Northern road?—A. I know that there is one man that has stock in the Great Northern road that is heavily interested in the elevator companies. This information I got in Minneapolis.

Q. Do you think that there is a community of interest in the management of the elevators and the road?—A. I have no doubt of that. I know that the same parties are interested in both, but they are operating absolutely separately. There was a time when the elevator lines got a rebate from the railroad at the end of the season on shipments. They do not get it any more. There was one line of elevators at the end of the season that got a rebate of 2 cents per 100 pounds.

Q. (By Mr. RIPLEY.) In cash?—A. Yes; in cash. They do not get that any more. It has been abolished.

Q. (By Mr. LITCHMAN.) Have you any laws in North Dakota for the inspection of grain?—A. I do not know of any.

Q. The inspection is done at the point of distribution—at Minneapolis and Duluth?—A. Yes.

A. And you are compelled to accept that inspection?—A. Yes.

Q. Is there no inspection at the farm—at the delivery to the railroad?—A. No.

Q. How do you grade the grain, then?—A. When we ship our grain we simply dump it into the car and seal the car, and consign it to a house in Minneapolis or Duluth, and leave it absolutely in their hands to get what they can for it.

Q. That commission man superintends the inspection of the grain in Minneapolis and Duluth?—A. Yes; and if it is too low he appeals, and it is reinspected.

Q. That inspection is made by the State inspectors?—A. Yes.

Q. What percentage of the farmers have to sell their grain within 3 or 4 months of thrashing?—A. They nearly all sell within 3 months after thrashing.

Q. All, substantially, then, of the grain is sold within a short time after thrashing?—A. I think 75 per cent of it is sold at once.

Q. Is there sometimes an advantage in holding the grain?—A. Only when a man like Leiter would appear upon the scene; ordinarily there is not.

Q. Is the card price for grain lower during the months following thrashing than at other times?—A. No; I have averaged the prices for the 5 months—September, October, November, December, and January—and I find that the average price is within a fraction of a cent the same during that whole time.

Q. How does that compare with the months succeeding January?—A. It is very dull then—the market is very dull—and unless the price is stimulated there is no

advantage. The only advantage would be probably to hold it over until June or July, and it is a question whether it will pay, because the wheat will shrink during that time and the demand is reduced.

Q. You think the system of rebates given to elevator companies by railroad managers has been discontinued?—A. Yes.

Q. Actually, or on the surface?—A. No; I believe it is actually discontinued—that is, on the Great Northern where the people are compelled to use that line only; but I believe it exists where there are competing lines.

Q. (By Mr. FARQUHAR.) Have you any positive knowledge of that?—A. I have. My positive knowledge consists of information from those who know. Of course, I am not supposed to give the sources of it, but it is inside information that I have.

Q. Have you any general statement to make on any of these points that you have been questioned about?—A. The only statement I should like to make would be to impress upon the commission here that the evil we suffer most from is the inspection in Minnesota.

Q. The inspection?—A. Yes; I believe that that office should be taken out of the hands of the governor of Minnesota; that a man should be appointed to that office because he is fit for it, and he should be allowed to appoint his own deputies and not take everybody that the governor sees fit to thrust upon him. I believe that the greatest evil that we suffer from is right there.

Q. (By Mr. RIPLEY.) Do you recognize any difference in the way of grading wheat or in the way of handling it in Minneapolis and St. Paul as against Duluth?—A. No. It all depends upon which man happens to be at Duluth and which man happens to be at Minneapolis.

Q. There is no difference in the system?—A. No; there may happen to be a more able man at Minneapolis or at Duluth.

Q. (By Mr. LITCHMAN.) How does the system of inspection at the present time compare with what it was in former years?—A. There is no very great difference.

Q. You think it is as fully expert to-day as it has been in the past?—A. It seems to me so. We have all the grievances now just the same as we had then. We are not favored any more. At times we get an exceedingly good rate; at times, for the same sort of wheat, we get very little.

Q. Have you any means of judging how the wheat in your section compares with that in South Dakota as to quality?—A. I do not know much about South Dakota, but we raise an excellent grade of hard wheat.

Q. And it grades well in quality with other wheat, does it not?—A. They do not give us the grade we should have. We do not always get the grade that Minnesota wheat gets, while we should have a better grade. Our wheat is the wheat that they use for mixing to elevate their own grades—to raise them up.

Q. Could that trouble be reached without some interstate law covering the three States?—A. That is what I believe. I believe that is the real remedy.

Q. A system of inspection established by the three States?—A. By the four States; I should also include Wisconsin.

Q. As I understand it, Duluth accepts the grading of the Minneapolis market?—A. Not always, but as a rule. As a rule, those men at the line elevators that have the faculty of standing in with the inspectors can make an immense amount of money, and they do it. They did that in the flax shipment this fall. Flax was either No. 1 or "rejected." All the flax bought up in our country was graded rejected, and it was a good grade of flax. It was bought as rejected and brought rather a low price. It came down to Minneapolis and there it was graded No. 1 and shipped up to Duluth. The inspectors there are made to verify that grade, No. 1, and so they have had No. 1 flax that they had contracted to buy delivered at Duluth, and they made that tremendous margin. They bought it at 30 cents, below No. 1, at our market, besides the margin, which was at that time about 25 cents; so they made a clean profit of 55 cents on a bushel of flax. That is a good deal.

Q. (By Mr. LITCHMAN.) You think there is a collusion, then, between the inspectors and elevator men?—A. Yes.

Q. Is that a matter of opinion or a matter of evidence?—A. A matter of fact.

Q. Of which you have evidence from confidential sources?—A. Yes; from confidential sources.

Q. Those sources you think it inexpedient to give?—A. Yes; I should rather not give them if it would make no difference.

Q. (By Mr. L. HARRIS.) Who furnishes the capital for your local elevators to buy grain?—A. The corporations. In the busy or most active time of delivery or purchase of wheat they borrow the money at the banks on their storage tickets,

or their local agents draw on the house for \$500 or any amount that they want and the owner pays that in cash.

Q. Are the managers of your elevators citizens of your town?—A. No. They go from point to point. Where a man is disliked they remove him; when the community does not like him they send him to another place.

Q. They are in the employ of the different companies that own the elevators?—A. Yes.

Q. And the capital is supposed to be sent out from those companies for the movement of grain?—A. Yes; that is the way they do it—through the banks. Of course, that is to prevent shipping currency to the agents. Sometimes, if they expect a heavy movement of wheat, they ship \$2,000 in money to the agent. Then the agent has no wheat to buy and he is compelled to carry that money on his person. That is undesirable, and they allow him to draw through the bank for the amount he needs, and sometimes it goes through the bank two or three times.

Testimony closed.

WASHINGTON, D. C., February 12, 1901.

TESTIMONY OF HON. I. B. NALL,

Commissioner of Agriculture of the State of Kentucky.

The commission met at 10.12 a. m., Vice-Chairman Phillips presiding. At that time Mr. I. B. Nall, commissioner of agriculture, Frankfort, Ky., appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. A. L. HARRIS.) You may state your name, your address, and your official capacity, if you please.—A. My name is I. B. Nall; my position, commissioner of agriculture of the State of Kentucky; residence, Frankfort, the State capital.

Q. How long have you held the position of commissioner of agriculture?—A. I was elected, I reckon, in 1899. We had a contest, which was decided in my favor, and I have been the occupant of the office since February, 1900—about the 26th day of February.

Q. What was your occupation previous to your election as commissioner of agriculture?—A. Immediately preceding that I was president of the American Attorneys' Contract Company, of Louisville, and for 20 years before that editor of the Farmers' Home Journal, a paper on agriculture, published at Louisville; also for 10 years secretary of the National Saddle Horse Association, now changed to the American Saddle Horse Breeders' Association.

Q. Have you ever engaged in farming practically?—A. I have, previous to taking charge of the Agricultural Journal. I may say I was raised on the farm, and then, after 4 years' service in the army, I went to farming in the Blue Grass section of Kentucky.

Q. Have you kept in touch with the industry from that time until the present?—A. I have; yes.

Q. You may state, if you please, whether there has been an increase or a decrease in the farm laborers of your State compared with 30 or 40 years ago.—A. Our population has increased, our farm acreage has increased, and I may say that the number of agricultural laborers has increased in proportion.

Q. What is their condition now compared with their condition at that time?—A. The labor employed in my State is very largely colored labor. Forty years ago the colored laborers were slaves, and the master, as a rule, was expected to see to their comfort and take care of them, especially when they were ill. They were cared for as comfortably as could be. It was to the interest of the master to do so, especially of the younger ones, as they were valuable as they grew up. Now they are mostly congregated in the outskirts of the towns, and whilst I believe a free man is always better off than a slave, I must confess there are times when they suffer from disease, and their condition is, I believe, not so good as it was when they were slaves—that is, their personal condition, their physical condition. They are subject to smallpox and other diseases that carry them off, and I do not think the rate of increase is as great as formerly. I have no statistics to support that statement, but I think so, just from observation. They are not in any better condition, but at the same time I believe a free man is better than a slave.

Q. (By Mr. PHILLIPS.) Is it the feeling in the State that their condition is not so good as it was when they were slaves?—A. It is pretty hard to answer. I sup-

pose at first prejudice may have had something to do with the sentiment. In a large part of Kentucky—the agricultural part—the farmers were slave owners largely, and there was some prejudice existing, and to some extent probably that kept down a feeling in favor of improving that race; but I think now that has all died out, and for several years back we have had more liberal educational laws. We still try to separate the colored from the white people as much as possible in social relations. We have separate coaches on the railroads for them, but we demand that the carriers shall furnish equal accommodations for the money paid for the white and the black, and we have equal school facilities.

Q. The educational facilities, then, are better now than they were in the days of slavery?—A. There were no educational facilities then at all. It was forbidden that they should be taught. It was almost a rarity to find one who could read. A man could not teach a colored school at that time.

Q. (By Mr. LITCHMAN.) Right in that connection, I understand you to say that the condition of the colored man is worse now than under slavery?—A. No; it is better now as to educational facilities.

Q. Do you know of colored people that have acquired property?—A. Yes.

Q. Give us a little information along that line.—A. I can not say positively; some of them are better off, I know, but a great many of them are not so well off; they have suffered from disease. As I say, I would not risk the statement that they were worse off, because I believe in freedom. I believe it was the best thing ever done to free them, and that their destiny is working out. We do not now keep the amount and value of land owned by white and colored persons separate. The last figures I have show that colored people owned 171,570 acres of land in the State, valued at \$1,172,206, and 5,027 town lots, valued at \$1,131,871. They also owned 12,508 horses, valued at \$376,726.

Q. I would like to ask whether this impression is of your immediate surroundings or whether it covers the entire South.—A. I am only answering from my surroundings—for the State of Kentucky generally. I do not know the conditions farther South, where the colored population predominates.

Q. (By Mr. A. L. HARRIS.) Is your farm labor regularly employed?—A. Yes; the laborers can get regular employment, and usually they hire by the year, with the wages payable every month. Soon after the war there was more paying by the year, but since that period they have changed mostly to the method of payment by the month.

Q. How much is that?—A. Well, per day agricultural labor gets 50 cents to \$1.50. In rare cases they will get sometimes, in harvest, \$2.50, but not so much now as they did a few years ago. By the month, where the hand is boarded, the pay is \$11.50 to \$14, and running as high as \$15. Then, per month, without board, where the hand lives on the place, the farmer furnishes the house for him to live in, and the wages run from \$15 up to \$23, and sometimes a good hand will get \$26 or \$27, because he may be a specially good horseman, or something of that kind, that is needed. The average pay runs from \$16.50 to \$19.10 per month where they board themselves.

Q. (By Mr. PHILLIPS.) Are they chiefly or wholly colored?—A. Well, 41.5 per cent of the labor employed on the farms in the State, in the agricultural portion of the State, is colored; of the rest, I would guess that perhaps 25 per cent was white labor and the remaining 25 per cent owners. These have smaller farms and in the mountain section mostly, where very little labor, black or white, is employed, the work being done by the owners themselves.

Q. Of the white laborers, are they almost all American or are they foreign?—A. About 60 per cent of the white labor employed, I suppose, would be Americans, I should think. We have around every city a drift of German population, thrifty Germans that take up little places. They locate around Louisville, Lexington, Covington, Paducah—more or less near all of the towns. They do well, and they embrace a considerable portion of the labor. They work their own farms as a class rather than get out and hunt positions.

Q. (By Mr. CLARKE.) Are the laborers who board themselves frequently housed on the premises rent free?—A. As a rule, yes.

Q. Are they allowed any privileges, like a garden patch, or free access to the woodlands?—A. Yes; usually they have their little houses set apart, a pasture for a cow, and they also have their fowls and pigs. I think that system might be improved, though. I think it would be much better for us, and I am going to recommend it always, that they furnish those homes and make them more inviting, and, under another head, I may be more explicit on that point.

Q. (By Mr. A. L. HARRIS.) About what is the average number of days employed?—A. The answers I have to that question made in reply to inquiries I made after receiving the notice that I would be wanted here, place the number

at from 240 to 300 days. In some parts of the country where they are employed by the month they let them go, and I suppose that they engage in other work not in the agricultural line, or perhaps they go from one to another; one may have winter work and another be willing to do without. I do not suppose that the laborer is just thrown out without anything to do, because we know there is usually something for every man to work at in our State.

Q. Is there a tendency to seek other employment?—A. I may say, yes.

Q. You may state the reason why.—A. In the first place, our labor being largely colored, the laborers like to get together. They like to live in the suburbs of a town, in groups, their houses all on one street or in one section; they enjoy life more when thus situated. In addition to that, they are drifting largely to the large cities, where the factories employ them, and they are employed by the week or by the day, and they get better wages than they do on the farm. I think their wages are somewhat higher in these factories than I quote here for farm labor, but the cost of living is greater and may equalize advantages.

Q. (By Mr. CLARKE.) What is the nature of their employment in factories?—A. We have large tobacco interests, and the handling of this tobacco that is raised upon the farm is an important line of work. It is generally brought to the factory in wagons. Quite a number of the larger towns are big markets for loose tobacco, and that is all to be handled and redried, and in some of them they strip it, take the stem out, preparing it for foreign shipment—export. Many of these hands are employed at that work. They seem to be very fond of that kind of work and rush to a factory. Then, where they manufacture tobacco for home use—our domestic manufacturers—they employ hands in stripping and sorting, and every factory that we have employs some teamsters, etc., if they do not even put them into the actual work in the rooms. The colored man who is a teamster makes pretty good wages about the cities. Of course he can spend his money there more easily, and he doesn't come out with any more in the end.

Q. (By Mr. A. L. HARRIS.) Have you a remedy to suggest for this condition?—A. My remedy would be to make them happier in the country, recognize their social necessities, in order to, if necessary, encourage the better class of them, with their families, to settle at some convenient point in the neighborhood of large farmers, within reach of them at all times, and make their homes comfortable, regulate them as to their morals, etc., and establish their churches, their schools, and improve their condition and ambition, if possible.

Q. What is the condition of the ordinary farm tenement?—A. As a rule it is not as comfortable, I think, as it should be made. The tenants are expected to occupy quarters that are hardly as good as they should be. Of course there are many exceptions to this. They are willing to accept these rather uncomfortable houses. They can stand, it seems, a great deal of discomfort. I am speaking now of the colored labor in particular.

Q. (By Mr. CLARKE.) Are these houses generally frame houses?—A. Frame or log, as a rule.

Q. Divided into how many rooms?—A. As a rule about 2 or 3 rooms. The average farm house is a couple of rooms with a shed room attached, maybe.

Q. Do they have chambers?—A. Not in addition to these rooms.

Q. Do they have wooden floors?—A. Yes.

Q. Cellars?—A. Not as a rule; you will scarcely find one with a cellar.

Q. (By Mr. A. L. HARRIS.) Are wages paid in cash or with store orders?—A. As a rule in our State the payment is in cash. The employer will sometimes give orders on the stores that are equivalent to cash.

Q. (By Mr. PHILLIPS.) Would the stores sell them as cheap as if they paid the cash on orders?—A. I think so, just about the same as the proprietor would get. They treat them in that respect just like they would the proprietor of the farm.

Q. (By Mr. LITCHMAN.) Is there any pressure brought to bear to induce a man to trade with a company store?—A. I am speaking of farm labor now. The farmers have no company stores.

Q. How does the practice of giving orders on stores, arise then?—A. From convenience. The hand may be going to town on some Saturday evening, and the farmer not; the hand would want to draw a little of his salary, maybe a few dollars, and the farmer not having a check at hand (usually our farmers are depositors in the banks, especially in the blue grass region)—gives the laborer an order on the store rather than a check. He can not get the check cashed, as a rule, and he may want provisions or something at the store.

Q. (By Mr. A. L. HARRIS.) Have you any crop sharing?—A. Yes; that system is growing in the State.

Q. You may state upon what terms that system is prevalent.—A. It is growing, especially in the blue grass region, because of the introduction in the past 15 or

20 years of the culture of Burley tobacco. The blue grass country before that produced no tobacco, we will say, but, with the discovery of this type that was adapted to that soil, it spread very rapidly, and now nearly all of the blue grass counties are more or less engaged in growing Burley tobacco. The owners found that they did not know how to handle it so well with their colored labor, and they induced white labor to come from the more hilly and poorer sections of the State, along the Kentucky River, largely, and up the Ohio below Cincinnati. They let the tenant have whatever number of acres of ground he wants for growing a crop of tobacco. They furnish a house, pasture for a cow and a horse, a few acres for growing corn, and a garden. Sometimes these are free, sometimes a charge is made for them according to contract. The farmer selects the best land for the tenant, and they divide the crop of tobacco at the warehouse equally. In other words, it is sold at the warehouse, and when the expenses are taken out the tenant gets half the money and the farmer half of it.

Q. Who furnishes the team?—A. The tenant furnishes the team. Sometimes that is a matter of contract between them. If the farmer furnishes the team he is entitled to so much pay for it.

Q. Which is the most practical of the two, hiring or crop sharing, in your judgment?—A. Crop sharing is the most satisfactory for tobacco. It doesn't extend over the whole crop, as a rule. In our State a good deal of corn land is put out, but with that the tenant is not furnished a house, as a rule. He takes the land and cultivates it for one-half, he furnishing all the labor.

Q. Does the landlord furnish the supplies and take a lien on the crop?—A. If he makes an advance it becomes a lien on the crop.

Q. Have you a lien law that protects the landlord?—A. Yes; I have a copy of it with me here.

Q. You may just state the substance.
(Witness reads as follows:)

“LANDLORD AND TENANT.

[Kentucky Statutes.]

“SEC. 2323. A landlord shall have a superior lien, against which the tenant shall not be entitled to any exemption, upon the whole crop of the tenant raised upon the leased or rented premises to reimburse him for money or property furnished to the tenant to enable him to raise the crop or to subsist while carrying out his contract of tenancy. But the lien of the landlord shall not continue for more than 120 days after the expiration of the term, and, if the property on which there is a lien be removed openly from the leased premises, and without fraudulent intent and not returned, the landlord shall have a superior lien upon the property so removed for 15 days from the date of its removal, and may enforce his lien against the property wherever found.”

“SEC. 2325. Contracts by which a landlord is to receive a portion of the crop planted, or to be planted, as compensation for the use or rent of the land, shall vest in him the right to such a portion of the crop when planted as he has contracted for, though the crop may be planted or raised by a person other than the one contracted with; and so, if the land be planted in a different kind of a crop than the one contracted for, and for the taking of or injury to any of the crop aforesaid, the landlord may recover damages against the wrongdoer. The landlord may also have an injunction against any person to prevent the taking or injury of his portion of the crop aforesaid; but nothing contained in this section shall bar the landlord of his right to such damages against the person contracted with as he may sustain by reason of the land being planted, without his assent, in a crop other than that contracted for, or not planted at all, nor for failure to cultivate the crop in a proper manner.

“This section shall include a purchaser, without notice, of a growing crop or crops remaining on the premises, though severed from the land; but it shall not apply to a purchaser in good faith, without notice, of a crop after it has been removed for the space of 20 days from the rented premises on which it was planted.”

“SEC. 2326. A tenancy at will or by sufferance may be terminated by the landlord giving 1 month's notice, in writing, to the tenant requiring him to remove.”

“SEC. 2327. When a tenant enters or holds premises by virtue of a contract in which it is stipulated that he is to labor for his landlord and he fails to begin such labor, or if, having begun, without good cause fails to comply with his contract, his right to the premises shall at once cease, and he shall abandon them without demand or notice.”

Q. Is the law satisfactory to both parties?—A. It seems to be.

Q. What per cent of your labor is colored?—A. As near as I can get at it for the whole State, 41.5 per cent.

Q. Is that percentage spread regularly over the State, or are there sections in which the colored labor comprises a larger percentage?—A. The percentage is greater in sections. I have here a plat of the State in sections, showing the sections in which colored labor predominates. The colored labor predominates in sections No. 1, No 2, and No. 3. There is very little colored labor (except in the mining districts) in No. 4 and No. 5. I am referring now to agricultural labor.

Q. Your papers explain that division of your State into sections?—A. They do in reference to farm labor.

Q. Could you let the commission have that map?—A. Yes; with pleasure.

Q. You may state briefly, if you will, how that subdivision is made, and what object you had in making it?—A. This is a division I made since I became commissioner, because of the character of the soil in different parts of the State, and also to separate the mountainous part from the agricultural part. We have 3 separate divisions of the agricultural part. In division No. 1, 95 per cent of all the dark export tobacco is grown and handled; in No. 2, perhaps two-thirds of the red tobacco is grown for domestic manufacture and also the greater portion of what is called "regie" tobacco.

(The map referred to is reproduced on the opposite page.)

Q. Please describe export tobacco —A. Export tobacco, in the sense in which I use the term now, is grown in division No. 1. It is the long, heavy tobacco, strong and black, raised in the Clarksville, Hopkinsville, Paducah, Owensboro, and Henderson districts. It is marketed mostly loose in wagonload lots, rehandled and straightened, and rehung in very large factories. It is brought to market in seasonable weather, and, that especially going to England, is stripped, the stem being taken from the leaf. That is done in order to make it lighter. It pays a duty of 86 cents per pound when taken from the Government warehouse there.

Q. In England?—A. Yes, in addition to the cost of the tobacco. It goes into a bonded warehouse, and of course they don't want to pay the duty or tax on the stems.

In the second district is grown largely the tobacco used in domestic manufactures, and what is known as the "regie" type. It is shorter and redder.

In the the third district is grown about 90 per cent or 95 per cent of all the white Burley tobacco. That is the variety originated just across the river, in Ohio. Its cultivation has spread all over the blue-grass region.

Q. What is that tobacco used for?—A. It is used almost exclusively for domestic filler and wrapper; more for fillers than for wrappers.

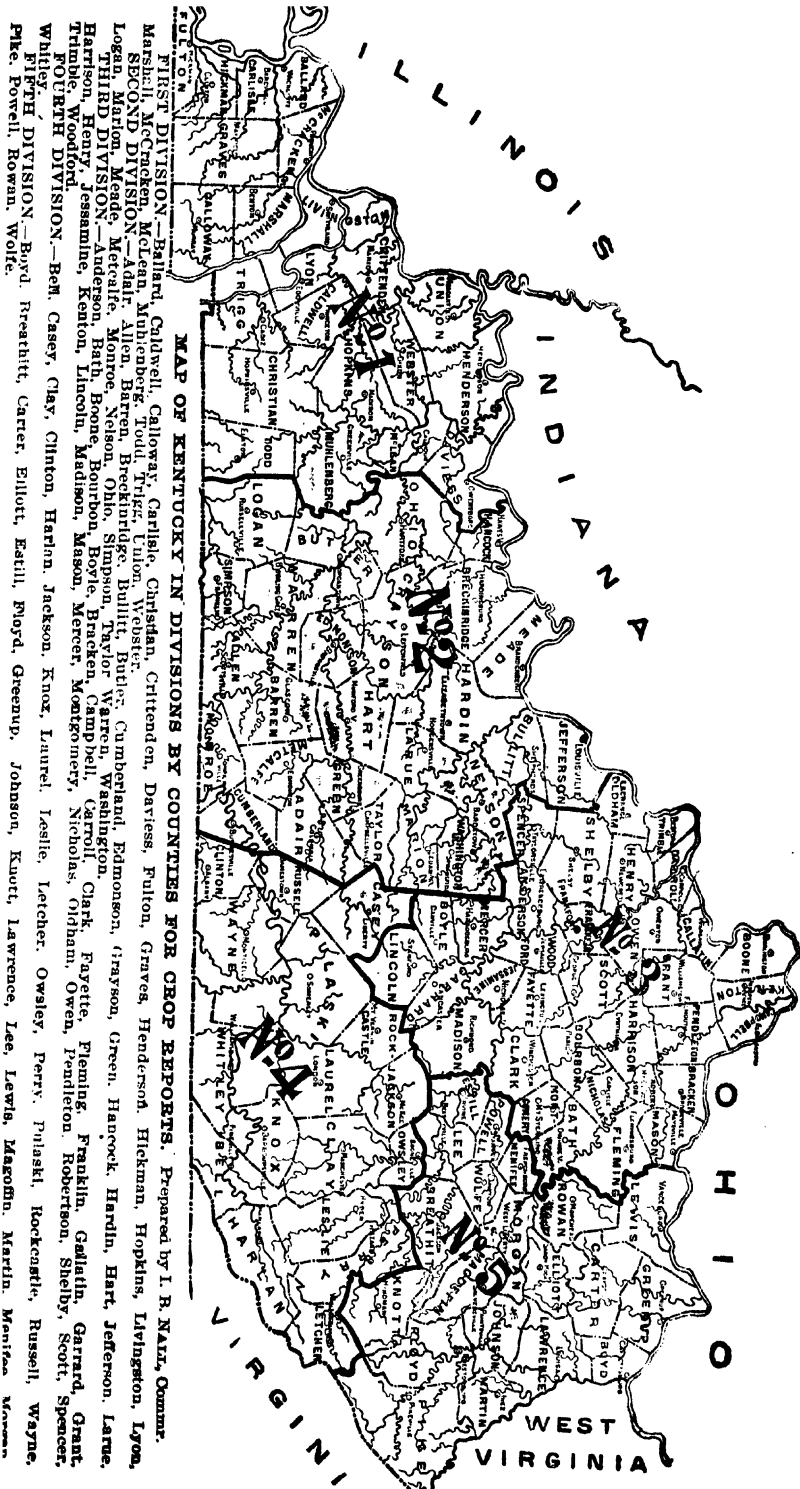

Q. Is any part of it manufactured into plug tobacco?—A. That is what I speak of—filler for plug. It has a splendid leaf, is light in color, and will absorb a great deal of licorice, moisture, sugar, and other things which are cheaper than tobacco. I do not chew tobacco, but I know what plug is made of. They are breaking up the blue-grass pastures to raise that tobacco. It is more profitable than grazing.

Q. (By Mr. PHILLIPS.) Can they grow more of it per acre than of the other kind of tobacco?—A. No more than they can in the rich agricultural districts in district No. 1, but more than they do of that for domestic manufacture grown in district No. 2.

Q. (By Mr. A. L. HARRIS.) How is that tobacco cured?—A. The Burley tobacco is cured in barns without fire. The black tobacco is cured by fire; big fires under it.

Q. Kiln-dried?—A. They make kilns, yes. It is the heat they want, but they do not want smoke on it. You see, the purchasers stick their noses in the samples, and if they smell smoke on it, it injures the tobacco. The presence of smoke does not, however, seem to affect the tobacco shipped to the English and German markets.

Q. Do you raise what is known as cigar tobacco in the Second district?—A. If a crop of that kind is raised it is by accident—some condition in the curing process, perhaps. We do not attempt to do it, I believe, at all, and very little of the tobacco grown in our State is used for cigar making. We tried it and found it did not go in our State. We have, then, districts Nos. 4 and 5, two mountainous sections. There, of course, the mineral and timber interests predominate, but all along the valleys there are some pretty good fields, and they are cultivated, as sometimes are the tops of the ranges; but as a rule it is not a very good agricultural district. They are running railroads into it and developing the mines and the timber interests, and now I suppose that, taking the whole country over, they do not raise as much in the way of farm products as would feed the people there since they have got so many miners working in the mines. Their money product

Q. Or are they sharers in the extra profits that are brought into them otherwise in the stores?—A. They do that, of course; they are recouped to a great extent for their losses by trading and trafficking with these people, but they only continue to do that when they can do no better.

Q. (By Mr. LITCHMAN.) I would like an answer to the question of Major Farquhar as to whether the land owners are native Georgians or men from outside?—A. Oh, yes; they are native Georgians. There is no land that is owned in our country that is under cultivation, except by people who live there and own the land.

Q. (By Mr. FARQUHAR.) Now, a man in continual debt, wearing out the land there for 10 or 15 years, is practically in slavery?—A. Yes; I think that is it.

Q. He is so tied up that it is impossible for him ever to escape it?—A. Yes; I think so.

Q. And one successive debt follows another there like an endless chain, and there is no hope for a man?—A. In many cases that is true.

Q. It would take probably a great season and an advance in crops to some abnormal prices probably to lift him out of that debt, would it not?—A. Yes.

Q. Normally he could not get out of debt?—A. Normally he would not at all. A great many of the tenants go on these lands possibly and farm them, say, for 5 years, and then they have poor prices and poor crops, and they become discouraged and throw up the whole thing and get out.

Q. (By Mr. TOMPKINS.) At the end of any one year they do not have to work there the next year?—A. Oh, no.

Q. Is there any reason why a man should not take another place and make a new start?—A. Not at all.

Q. Is the indebtedness any design on the part of the government or the renters holding to a condition of poverty, or is it the result of some other influence?—A. There is nothing whatever to force a man to stay on the farm. They usually rent these lands from year to year. The lands are not leased for continuous years, but usually they are rented from year to year, and if the landlord becomes dissatisfied at the end of the year he need not retain the tenant longer unless he wants to keep him. If the tenant is dissatisfied for any cause, he has a perfect right to go whenever he wants to. The landlord has no lien and no claim upon the property of the tenant whatever except for rent and advances, and those only apply to the present crop. To illustrate: Suppose I rent from you a farm and I agree to give you so much money for it, or I agree to give you so much cotton for it. We will say I rent a 2-horse farm now and agree to give you 1,500 pounds of middling cotton. It is possible that I have not supplies enough to make that crop with. I go to you and you advance me the supplies and charge them to me on your book and take my note for them. Under the law all the crop made upon that farm for that particular year is liable and subject to that debt for rent and supplies furnished for that particular year, and there is nothing that you can keep you from collecting that debt from me, provided I make enough to pay it, except we have what is known there under the general law as the "pony homestead," which gives to every man at the head of a family his household goods and his horse and \$300 worth of provisions and so on. That is exempt by law, but the balance of the crop would be subject to the rent and the supplies furnished for that particular year. Suppose now that I wanted to leave that place this year. You would have no claim whatever on me to hold me there, nor any claim on whatever I might have. You could go and sue me in the common court and get a judgment and follow me up in that way under the common debt.

Q. (By Mr. LITCHMAN.) What would be the position of a man, however, who had defaulted on one farm? What would be his probability of being able to get another farm in that locality, provided he did not liquidate his indebtedness in the first instance?—A. Oh, he would not be regarded as a first-class tenant. But there is always plenty of room there for everybody, and he always gets a place and gets along in some way. Some people always take him up.

Q. (By Mr. TOMPKINS.) Is there ever any inducement offered to a tenant to quit and go to another place?—A. Oh, no. I have never seen a man in Georgia yet who wanted to work that could not get a place.

Q. Then, to return to the original question, what is the cause that leads to tenants working the farm for one year and coming out short at the end of that year? Is it because, as we understand it, they work single years at a time totally independently of each other?—A. I did not mean to say that they all do that; but I mean to say that there is nothing to force them to stay on the farm.

Q. I understand, but I am trying to get at the cause of the deficiency.—A. It is a hard matter to tell just what that is. Sometimes you have a tenant on a place, and he finds he can do a little better somewhere else, and he moves off and goes to the next place. Sometimes the landlord finds that he can get a better tenant

than the one he has. He lets this fellow go and gets the other fellow. They are continually moving around from place to place.

Q. (By Mr. LITCHMAN.) Is not there first the fact of his being compelled to buy his supplies at an enormous profit over the actual cost?—A. Yes; to some extent that would be true.

Q. And if the owner of the land was also the owner of the store, is it not possible for the owner of the land to keep him in debt all the time year after year?—A. No; I do not think that is true. He would like to see him up to date.

Q. (By Mr. FARQUHAR.) What would you say is about the average profit or interest that is made on that class of crops in the stores?—A. The percentage would be somewhere in the neighborhood of 20 to 25 per cent. That would be the actual profit. That is to say, you furnish a man with corn that costs 80 cents a bushel delivered there for cash, or you could go the store and buy for 80 cents for cash; you would charge for that corn, to be paid next fall, \$1 a bushel. A pair of shoes that you would buy for \$1 cash would be charged for at the price of \$1.25.

Q. Now, would you say, because this crop lien system and this system of dependence is maintained and kept up, that it is a better paying way than working your own farm?—A. Oh, no; I would not say that.

Q. Then what is the necessity of owners of land there driving these hard bargains with these people?—A. For instance, you take a man down there who owns, we will say, 2,000 acres of land. He can not work that land himself. He has either got to cultivate that land by hiring men for wages and paying so much per month or one-half at the end of the month and one-half at the latter part of the year, or he has to rent it to a tenant for so much money per acre or so much cotton, or he has to share it out and crop it out with a tenant upon the plan which I have suggested here. He has to adopt one of these courses. The most of the landowners down there live on the farms themselves and cultivate what they can, then they turn out or rent out the balance of the land under these systems.

Q. Would you say that it paid the owner of the land better to have this tenant system than it would to cultivate the land himself?—A. Oh, no. It would be better for the landowner, as suggested here, to cultivate that land and control it himself, much better for him, and it would be better for the tenant; but there is another trouble on that line. The tenant when he rents the land is his own manager. He controls his own affairs; he goes when he pleases and he comes when he pleases; he is under the control of nobody at all. In most cases they prefer to do that. Now, when he comes along and hires out for so much per month standing wages he is under the control of the landlord; that is to say, he is expected to be there at sunup Monday morning and to work until Friday night. Very few people there work on Saturday. Saturday is usually a holiday and all of them quit Saturday at 12 o'clock.

Q. You would not say that the tenant farmer does not work just as hard as the hired hand?—A. Oh, yes; he works just as hard. He works right along just the same as the laborer.

Q. And he is his own overseer as well as his own workman?—A. Yes.

Q. Now, you have not given us the reason yet why this system is maintained and kept up—this system of crop sharing. Is it because of the poverty of the men who own the land? Is it because they can make more money out of this system? Is it because the laws of the State are so onerous that it is impossible for the black man to right himself and that he has got to take what he can get?—A. That is exactly what I want to speak about. It is a matter of impossibility for me to state what the reasons are. All I can do is to give you a statement of the facts. There is no reason in the world why a man should stay there and rent land unless he wants to. He prefers to rent it for the reasons I have given you. If he becomes his own manager, he is under the control of nobody; then he comes and goes when he gets ready; he works when he wants to and quits when he wants to. Now, the landlord does not rent this land so long as he can get better labor, but it is impossible to get just the kind of labor he wants all the while and have it just like he wants it. You understand, as I have said here, that it is not to his interest to rent these lands all the while, but he rents it in the absence of something better. Now, in my judgment, and in the judgment of all farmers down there, we think it is best to hire these laborers for so much wages per month. You can control the labor better and manage it better, and a man can take care of his land and take care of his stock better. But you just can not do it every time, and there is no rule down there to make a man stay on a farm if he does not want to stay. There is no law to compel him to do so. He can leave when he gets ready; he can leave you in the middle of the crop if he wants to. He can work clear up to Saturday night and leave and never tell you good-bye, and you may never see him more, or he can go on the next man's farm and live there.

Q. There is no judgment that would rest over a man of that kind?—A. No; there is no law by which you could pursue him at all.

Q. (By Mr. CLARKE.) Are growing crops attachable in your State?—A. No.

Q. (By Mr. TOMPKINS.) And also, does not the contract require that if the tenant agrees with you to make the crop he has got to stay the whole year?—A. No; there are no laws to that effect in our State.

Q. (By Mr. LITCHMAN.) What is the first step for a man that is compelled to labor for his living?—A. When he starts out on the farm he goes to a man and applies for a place. He takes him and tries him and sees how much he is worth to him, and they agree on a price.

Q. A step above that is the tenant farmer?—A. Yes.

Q. What opportunity is there given to the tenant farmer to become an owner of land?—A. Oh, well, we have hundreds of colored men who own their own farms.

Q. Is there any disposition to prevent this ownership on the part of the colored people?—A. None at all. I know of none.

Q. Have you any information to show the size of the farms usually acquired by these people?—A. Yes. In my county and in my own neighborhood, where I live, we have seven colored men who own their own farms. One of them owns 65 acres of land; another one owns 140 acres; another owns 280 acres; another 200 and odd acres of land, and another one owns 300 acres of land. They own all their own stock; they own property around there; they have bank accounts; their notes are as good in the bank as mine for any reasonable amount.

Q. A farm of about 60 acres is as small as can profitably be cultivated?—A. Oh, no; there is no special number of acres for a farm. We cultivate about 40 acres of land with 1 horse or 1 mule. The land is usually a light loamy soil that is easily cultivated, and these farms run all the way from 1 to 100 plows. I used to run 100 at once.

Q. You spoke a while ago of a 2-horse farm; that would mean about 80 acres?—A. Yes; that is about 80 acres.

Q. You spoke also about the system of retaining one-half of the earnings of the farm laborer until Christmas and turning that in to the amount of cash?—A. Yes; they get credit for that. That depends entirely upon the amount agreed to be paid monthly. Say that a hand's wages are \$10 a month. In addition to that pay he would be furnished with a house, fuel, a garden sufficient to make his vegetables and a potato crop, and with a house possibly for a milch cow, and at the end of each month, as he has agreed, the farmer pays him \$5 a month and puts \$5 to his credit to be paid at the latter end of the year.

Q. That would be substantially \$60?—A. Yes.

Q. What security has the laborer for that money?—A. A lien on everything in the world that the landlord owns under the law.

Q. The law protects the wages of the laborer, then?—A. The law protects the laborer entirely. You have nothing to do but go before an officer and swear to the amount, that so much is due for labor, and you can attach property wherever you can find it.

Q. Is there anything in the nature of public sentiment that sustains the safety and prompt payment of claims of that nature?—A. Yes.

Q. It is regarded as a debt of honor that must be paid above all else?—A. Yes; and a man who does not pay it and goes to law does not get any more labor at all. Public sentiment controls that.

Q. (By Mr. CLARKE.) Is there a garnishee process in your State?—A. Oh, yes.

Q. Could not that \$60 held by the landlord be garnisheed?—A. The garnishee law does not apply to wages. The law provides that wages for labor of any kind can not be garnisheed. Labor is protected all around. A man can go into your store and buy your goods to be paid for at the end of the month; but if he is working for me and I hold his money, you can not garnishee me.

Q. (By Mr. LITCHMAN.) I am glad you brought that point up, because I thought when you first mentioned it there was a loophole there by which injustice might be done?—A. No; the law in our State protects the laborer in every instance.

Q. Does it then operate in the nature of a sort of forced saving for the man himself, really for his benefit?—A. I do not know whether it does or not.

Q. Your opinion is if that system of saving were not enforced he would not have anything at the end of the year?—A. Well—

Q. (By Mr. TOMPKINS, interrupting.) What does he do when he gets it? Does he save it or spend it?—A. Oh, he spends it; yes, he spends it. I would like to state to you gentlemen that the colored laborers in our country as a rule are not financiers at all; they would spend every cent in the world that they make before it is made, if you would allow them to do it. There are exceptions of course to all rules and there are to this. Some of those people down there are industrious

and economical, and they succeed in life and do well. They make good citizens, behave themselves, attend to their own business, and are accumulating money.

Q. (By Mr. LITCHMAN.) What methods do you have of saving money?—A. Oh, we invest in real estate and in property of various kinds.

Q. Do you have savings banks and such institutions?—A. Yes; we have savings banks that pay interest on money; but this class of people never put any money in the bank for that purpose. They always invest it in some kind of property that pays much better than the savings bank. We have a number of savings banks all over the State that allow us 3½ per cent interest on monthly settlements. And a good many of our people take advantage of that. For instance, a man sells his crop in the fall, and he does not have to use his money until spring. He will put it in the savings bank and add a small amount of interest to it, and in the spring he will draw it out and go on and use it in his crop for that year.

Q. Is there a disposition among the colored people to acquire land?—A. To some extent there is.

Q. Does that disposition prevail among the better educated among them?—A. It prevails among all classes, those that are educated the same as those that are not. Usually where they are educated they become teachers, and preachers, and professional men. There are very few of them who have educations that go to farm life. A few of them branch off into merchandising; some of them do well and some of them fail.

Q. Has there been any improvement in the homes occupied by the colored people, taking a period of 20 years?—A. Oh, yes; very considerable improvement.

Q. A much better class of homes is being built for them and occupied by them?—A. Yes.

Q. How far is the movement in that direction assisted by the white people?—A. In the past the landlords have been forced to build better tenant houses and provide them with modern systems that are adopted all around, in order to retain and keep the best labor. That is really the way that a great many of our best people succeed in keeping their labor, and the better class of labor, by making everything around them as comfortable as possible.

Q. So that in the last analysis the benefit goes to the farm laborer of improved conditions for his work?—A. Yes.

Q. (By Mr. TOMPKINS.) There is one thing I would like to ask you, if you please, and that is in relation to the original question practically asked by Mr. Farquhar and by myself, both. I would like to learn what is the cause of the fact as you stated, that at the end of each year a great many of the tenants make no money—they are in debt. Is it because of the oppressive disposition of the white people to drive hard bargains, or is it because of the bad management of the tenant when freed from the general management and direction of the white people? Or is it because of the bad system? Are the system and the law bad?—A. The law has nothing whatever to do with the systems that are adopted for farm labor; nothing whatever. The only law that we have is the law that protects a laborer in collecting his wages, either one way or the other.

Q. Now, may I take the liberty of suggesting that that is a sufficient answer to that phase of the question. It is not the law. But is it the oppressive disposition of the white people?—A. No.

Q. Is it the indifference and bad management of the tenant?—A. Well, not every time; no.

Q. Then I understand the fact remains—

Mr. FARQUHAR (interrupting). The terms are bad, onerous on one side.

Q. (By Mr. TOMPKINS.) He says not.—A. No; you get the wrong idea entirely; entirely the wrong idea. I give you all the systems that have been adopted. I say and state here emphatically that the tenant system is a bad one, that we do not approve it, and to a great extent it is being done away with. Now, then, as to the cause for that, it grows out of the fact of bad management upon the part of ignorant tenants. I do not say of all the tenants, because they are not all ignorant. Some of them are men of intelligence, and they succeed in renting as well as they would succeed any other way. But as a rule the common colored laborers of Georgia are ignorant. That is to say, they do not know how to raise crops. They do not know what kind of crops to put in to improve the land. They have no disposition in the world to get out of that land anything but what benefits them—that is, to get the best crop that the land gives. That is the rule, and it applies not only to the colored laborer, but to the white laborer in the same way. Therefore, I state that it is a bad system, and we are trying to improve it as fast as we possibly can. Now, then, in addition to all that you must remember that bad seasons often come upon us and that low prices often come upon us, and all these things together go to make the tenant fail and become discouraged and fall into debt. As I stated in the first instance, he pays very large interest on the

supplies that he buys on time. He must therefore make a good crop, he must get moderately fair prices with fair management in order to pay his debts and accumulate anything.

I think the landlords are all against this system, and we are trying to overcome and remove it as fast as we possibly can. Now, in addition to what I have already stated on that line, possibly I had better state for your benefit that wherever we can sell small tracts of land to these people at prices that they can pay we try to do it. For instance, we sell them the land, depending entirely upon improvements, at from \$3 to \$7 per acre. We give them from 5 to 7 years to pay it in. The rate of interest in our State is 7 per cent. We are permitted, however, under special agreement to collect 8 per cent. We allow them to run this debt and pay 8 per cent interest. So long as a man keeps the improvements up and pays that interest we never trouble him at all. We have a large class of those people who are managing that way. Some of them are paying for their land, and some of them are not.

Q. (By Mr. CLARKE.) If the maximum rate of interest allowed by law is only 8 per cent, how can anybody collect 20 or 25 per cent?—A. Well, Mr. Chairman, it is not charged as interest.

Q. (By Mr. FARQUHAR.) Is it profit?—A. No. For instance, I come to you and say I want to buy a pair of shoes. You say, "Very well; do you want to pay cash?" "No; I want to pay when the crop is in, the 1st of October." Now, for a pair of shoes that I would pay \$1 cash for you would say, "I will let you have these for \$1.25." Those are what they call "time prices."

Q. Is that considered a legitimate system in Georgia?—A. Yes.

Q. (By Mr. CLARKE.) Now, I think we have got at the crux of this business.—A. Yes. Now, if I come to you and say, "I want to borrow a hundred dollars," you say, "Very well; I will let you have that hundred dollars, and I will charge you 8 per cent on it." That is put on the face of the note. I give you my note payable a year hence for \$108. When I come to buy a pair of shoes and you simply charge me \$1.25, there is no rate of interest mentioned; nothing at all. That does not apply to one class of people any more than it does to another, but that is a rule of trade and traffic.

Q. Has there been any attempt made by legislation to control that system?—A. Oh, no; I do not see how you could control it. How would you manage that?

Q. Maybe we shall be able to find some way to recommend.—A. I hope you will. I would be very glad, indeed, if you could. You will certainly have my cooperation. If it can be done, I am willing to come up here and see my Congressman and get him to help you out in it. I made a memorandum here that possibly would throw some more light on the subject, if the interrogation is not getting too long for you gentlemen.

On the question of immigration, I note that within the last few days a number of immigrants have been landed at New Orleans. They are mostly Italians and Hungarians. I am informed that they are to work in the sugar-cane fields in Louisiana. A few have been secured by the State of Alabama to work in the coal fields near Birmingham. This, however, is a mere experiment with this class of labor.

At present labor is not as plentiful in Georgia as we would like to see, and it is possible that later on the cotton mills may be forced to try immigrant labor. White labor is used almost exclusively in the cotton mills and other manufactories. In my opinion, the question of labor will naturally settle itself. The whites in our section will be given all the work in manufactories and positions of transportation where the wages are a sufficient inducement for them to take it. The colored laborer to a great extent—I might say almost exclusively—is inclined to agriculture, and will of his own accord naturally drift to the rich alluvial lands in the Mississippi Valley and possibly into Mexico. The negroes are inclined to a warm climate. The wants of the colored man South are few. He must have a house of worship, a schoolhouse, that he may send his children to school if he desires, and by all means he must have his tobacco and rum. I simply make these suggestions to you gentlemen because the inclination is all that way. They are drifting in that direction. I notice that whenever they move at all they go to a warmer climate—go in that direction.

Now, so far as our own State is concerned, the immigration of intelligent laborers or small farm owners modifies conditions in particular neighborhoods, and industrial education tends to improve any class of laborers.

(Reading:)

"Question 15. We have very little foreign immigration of any kind, most of the newcomers into Georgia being Americans from the North and Northwest, and from other Southern States. This class of immigrants make for us the most satisfactory citizens."

The truth is that we are not seeking people to come among us as common laborers. What we would like to have, and what we would like to see, would be people who make good citizens that would come there and take hold of our lands and settle among us and help us to develop the resources and become owners of them and enjoy whatever we might have. That is what we would like to see and what we would like to have, for the Southern people are intensely American and cling with tenacity to American ideas, but I would not have it understood that our people are unfavorable to the best class of foreigners, some of whom are among our best citizens.

Around Savannah, which is our largest seaport town, for instance, some of the very best people that we have are Germans. They have gone there and have gone into agriculture. They are producing vegetables in immense quantities. They have gone into the dairy business and make butter and cheese; and they are developing all that country around there, and their industries are extending back to a great extent into the interior. Now, that is the class of people that I have reference to here; people who come there and become citizens and take hold of what we have and develop it. They do not only do well themselves, but they help us. We get a great many good ideas from them, and they make the very best citizens we have. But their number is comparatively small. We welcome those who come into our State from any country to be landowners or men of business; but for ordinary laborers we do not seek or especially desire foreign immigration.

We believe that the negro, under the direction of the white landowner, furnishes the best labor for our cotton fields. In fact, there is no better. At present at least 95 per cent of all the colored labor that we have in Georgia has been either born and raised there or has moved in from adjoining States, and they are acclimated. They are not subject to taking the malaria like the white race; they are not troubled with chills and fever like the whites are; in other words, they stand our hot summer climate. They are accustomed to and speak our language, and they understand our customs, our manners, our modes and methods of cultivation and caring for and gathering the crop. The fact is, in my judgment there is no better labor known for the Southern States than the colored labor for common field work.

Q. (By Mr. LITCHMAN.) Is your indisposition to have foreign immigrants come in there due to any possible complication between negro labor and this foreign labor?—A. Oh, yes; I do not believe they would mix at all. Now, possibly I had better suggest right here that as a rule nearly all the labor that we have in our cotton factories and manufactories for all purposes is white labor. The white laborer and the negro laborer do not like to be together. They want to be separate themselves one from another, and for that reason the colored laborer naturally goes to agriculture because he feels free and easy there.

Q. So far as you know have you in Georgia any mills or factories run exclusively by colored labor?—A. No factories; no, none that I know of.

Q. (By Mr. TOMPKINS.) Any oil mills?—A. We have oil mills and a guano factory; but, of course, that is not very pleasant work for whites, and they do not like it.

Q. The colored labor has not been tried as yet in connection with cotton manufacturing?—A. Oh, no; in our State up to now I do not think there has been room for them. I would state here that in my own town, Griffin, we have 4 cotton factories. I do not think there is a colored man or colored woman working in those factories at all except to do the menial labor: that is, clean up around the premises, look after the seepage, and drive drays and do work of that kind.

Q. (By Mr. LITCHMAN.) Are those the mills that Judge Edmund Daniel is connected with there?—A. Yes; and I know they have no colored labor in their mill at all. It is all white labor except to do the menial labor around. Yes, Judge Daniel is one of my neighbors.

"Questions 17 and 18. The few foreigners in Georgia are compelled by their very surroundings to become Americans, adopting our language and conforming to our customs. What few foreigners there are there have little or no effect upon our agriculture.

"Questions 20, 21, 22, and 23. By far the largest percentage of agricultural labor in the South is furnished by the negro. Free tuition in the public school is provided for during 5 months of the year for the agricultural districts, and, by special appropriations by counties and cities, local taxation is levied to support public schools during 9 months in the cities and towns."

That you may thoroughly understand that, let us take the city of Griffin, where I live. Mr. Daniel is the president of the board of education of that town. We have a local act for the city of Griffin which permits the mayor and city council

to levy a certain rate to raise a sufficient amount to run those schools after getting the public school fund for a term of 9 months. We have there what is known as the public-school system. We get from the State a sufficient amount to run that school system for 5 months, and then an ad valorem tax is levied upon the property of the city to raise a sufficient amount to run it for 4 months longer, which makes 9 months.

Q. (By Mr. LITCHMAN.) Does that apply to the colored schools as well as to the white?—A. Oh, yes; it applies to all.

Q. You have separate schools, of course?—A. Yes; we have separate schools entirely, and it applies to all—not only in the country and rural districts, but in the cities where they live. In this ad valorem tax there is no distinction made whatever. The school buildings are separate and distinct one from another. The colored people have their own people and the whites have theirs, and one superintendent has charge of the whole system of all the schools, both white and colored.

Q. Are the teachers in the colored schools colored or white?—A. Colored.

Q. It is claimed that there is not the same quality of teaching in the colored schools as in the white; how is that in your locality?—A. That is a mistake.

Q. You think that would not apply to Georgia, from what you know?—A. Not at all; not at all. They have various grades there, and, of course, a man has got to come up on his examination to a certain mark before he gets a license to teach at all. He is examined by the county school commissioner and he is given a certain license. Now, for instance, when the board comes to select a colored teacher for a colored school, then the patrons of that school recommend some person that they especially desire to have teach it, and if the man or woman that they recommend or select comes up with his license and stands the examination all right, he is selected. Sixty-six per cent of all children are enrolled in these schools. This estimate includes negroes as well as white children, and the school age is from 6 to 18, inclusive.

The curriculum of our public schools is not now specially adapted to the agricultural class. But there is a move on foot to require the schools in the rural districts at least to teach nature studies, including text-books on agriculture, and everything pertaining to the theoretical part of farm life. The department of agriculture of Georgia has from time to time recommended legislation on this subject. There is a school of technology in Atlanta, and there are schools for technical training in Savannah, Macon, Columbus, and Sandersville.

(Reading:)

“ PART II.

“ CAPITAL EMPLOYED.

“ Question 25. Of the \$435,000,000 of taxable property in the State, \$165,000,000 represents the capital invested in agriculture, which includes the value of lands, \$120,000,000; the value of live stock, \$22,500,000; of farm implements, \$5,250,000; of household furniture, \$16,250,000. The income of this \$165,000,000 is shown by the following estimate of the value of the various crops of Georgia for the year 1900:

Cotton	\$54,000,000
Tobacco	27,000
Rice	1,200,000
Corn	18,000,000
Sugar	107,000
Sirup	1,295,000
Vegetables	1,000,000
Peaches	3,750,000
Apples	1,000,000

Total	80,379,000
To this add value of cotton seed	2,800,000

The income therefore is 83,179,000
Or 50 per cent gross or 8 per cent net.

“ Some idea may be formed of the general prosperity of a people by considering the percentage of those who own their homes and farms unencumbered. By the census of 1900, out of 352,059 families, there were reported 110,639 owning farms and homes. Of the number of these home-owning families 107,117 had no incumbrance on their homes and farms. The percentage of families owning free of incumbrance was very nearly 97 (96.82) per cent. There were 241,420 families

hiring homes and farms. The country banks hold a much smaller number of farmers' notes, and for smaller amounts, but have in their vaults much larger deposits from the farmers than ever before in the history of the State.

Total amount invested in merchandise.....	\$21,000,000
Total amount invested in banking.....	14,000,000
Total amount invested in railroads.....	46,000,000

"Question 26. Generally speaking, well-managed farms pay from 8 to 10 per cent on the capital invested.

"Question 27. The earnings of capital invested in farms compare favorably with the earnings of mercantile and other similar lines of business.

"Question 28. The tax rate of agricultural property is the same as the rate fixed for other property.

"Question 29. There has been a tendency for the past several years on the part of the agricultural class to drift from the farms into the cities. This is possibly not so great now as in the past. The cause is attributed largely to better educational advantages in the towns and cities than in the rural districts. The present condition of the agriculturists of Georgia is much better now in every way than for years past.

"Question 30. Overproduction in 1897 and 1898 of our main money crop, cotton, we think, had something to do with the decline in the prices of this staple.

"Question 31. The value of agricultural lands has greatly advanced in the last 3 years.

"Question 32. We are planting more largely of cereals, hence more vegetable matter is produced.

"Question 33. The increase in acreage in cultivation is attributable to diversification of crops.

"Question 34. The effect of underproduction has been to increase prices, as farmers because of the raising of supplies have been able to control the sale of their products, both cereals and cotton. The prices for wheat and oats have been advanced, and the price on cotton has greatly increased.

"Question 35. Intensive farming is generally claiming the attention of the people more than heretofore, and the utilization of barnyard manure from the raising of cattle, sheep, and hogs, has increased. The effect on production is favorable. Wages are increased because crops are more directly profitable and prices are better.

"Question 36. There has been in this State for nearly 60 years an organization of the leading agriculturists of the State in a State agricultural society; also a horticultural society and dairy association. These organizations are based upon the idea that the council of farmers will be generally helpful, and the object sought is the improvement of agriculture, horticulture, and dairy methods. These organizations, together with similar organizations less known, have very greatly benefited the farming conditions of the State."

Q. (By Mr. FARQUHAR.) At what place is your experiment station?—A. At Griffin, Ga.; my home.

Q. What color is employed for service?—A. They are mixed; both white and colored. Generally the farm labor is all colored. For the dairy products and entomologists' places and positions of that kind are usually filled by whites. But all the farm labor on the place is colored.

Q. Are there any agricultural or industrial schools in the State where they teach agriculture and manual training?—A. Yes.

(Reading:)

"Question 37. The production of grain up to this time has not been sufficient to meet the home demand, though this is more nearly possible now than for the last 40 years. Farm products of all kinds meet with ready sale in home markets, with generally remunerative prices.

"Question 38. There has been overproduction for some few years in cotton—about 1897 and 1898. The very great increase of cotton mills in the State and the South has now made this almost impossible with present conditions. There has been underproduction in corn and general farm supplies, which condition is now being very much remedied by the good prices received for our staple product, cotton.

"Question 39. As before stated, the diversification of crops is upon the increase.

"Question 40. The introduction of improved farm machinery, to which allusion has been made before, has made it possible to produce all crops at very much less expense, and therefore to very greatly increase profits.

"Question 41. Georgia, together with other Southern States, will of course receive large benefit from the opening up of markets for cotton in the Orient and the islands."

I believe what we need is an extension of our market for what we produce down there. I know that is contrary to the views of some of our leading men; but I believe that Georgia would receive large benefits from the opening up of markets in the Orient and the islands.

Q. Then you have no fear of the policy of the Government that gives to us the markets that are likely to come from our Oriental possessions?—A. Not at all. Supply and demand is what always controls the market. You can say what you please about everything else, but what we people need is a market for our output. We will go on until we raise 20,000,000 bales of cotton in our Southern and Western country, and you have got to have some place to put it. The whole thing is a failure unless you can sell it somewhere, and the more markets you can secure the better off our people will be. When it comes to a question of this kind, it is not a question of politics. We do not care what your policy is; but we want to do business. That is the way it strikes business men.

(Reading:)

"Question 43. The railroads in the State are operated largely under the control of the State commission, and transportation rates have been very greatly reduced since the organization of the commission.

"Question 44. Some counties in this State, notably the city counties, are giving very much attention to improvement of roads. The country counties are beginning to take it up, and the cost upon local transportation is very greatly diminished. The local markets for almost all agricultural products are satisfactory, and these products pass from the hands of the farmers most generally in their local markets.

"Question 45. There has been a very successful effort made in this State in connection with other Southern States to control the price of cotton, and the greater demands made by local mills, together with the efforts just mentioned, have given promise of very satisfactory prices for this product."

Now, I hope you will understand me there. I do not mean to say by organization or anything of that kind, but we have been trying to raise our home supplies and keep our people in a position where they would not be forced to throw all their cotton on the market at one time—so if a man had sufficient to live on at home he could sell a bale of cotton whenever he wanted to do so.

(Reading:)

"Question 46. The effect of grain and cotton gambling has been very hurtful to the farmers of the South, as indeed it has been to the general industrial interests. If some method can be introduced by which actual products will be sold and all gambling in futures suppressed, the price, in my judgment, will very greatly advance and farmers will be very much better remunerated for their labor.

"PART III.

"Question 47. It will require the wisdom of our national Congress to determine suitable regulations on trust combinations and other forms of monopoly. There are few, if any, means more important than legislation along this line. It affects not only the agricultural interests, but all the interests of the people, and combinations of this kind should be intelligently and successfully resisted and broken down."

I do not mean to say by that, simply because you have got a trust or something of that sort, it ought to be broken up, but where it is oppressive to the people and to business it ought to be suppressed; but do it intelligently.

(Reading:)

"Question 48. We have not felt any favorable results from existing antitrust laws or others mentioned in this question. Something more far-reaching will have to be enacted before favorable results will come to the farmers of this section.

"Question 49. The same statement can be made in answer to this number also, insisting that there should be very strong Federal legislation on all the subjects mentioned.

"Question 50. Farmers are generally careless, even when their own interests are to be affected, and nothing short of strong Federal or State laws will prevent the spread of diseases among animals or plants. This is especially true of live stock on the farms, and of our orchards. Possibly the most of these reforms can be better accomplished through State rather than Federal laws.

"While the condition of the farmers of Georgia is by no means all that it should be, under the advantages that we possess in our soil and climate, yet it is much improved over that of 1 year ago. The short cotton crop of 1889 and the fact that the mills of the South used more of the great staple than ever before combined to raise the price of cotton. For the first time in history the South fixed this

price, and the farmer who was so fortunate as to rush his crop upon the market received a good profit on his labor and investment. Another fact in the betterment of his condition is that he raised during the past season more than his usual food supplies, in consequence of which many debts were paid and many mortgages raised. The farmers of Georgia harvested last year more wheat than at any time since 1865; in fact, more than in any other 3 years since the civil war. More attention, too, has been paid to meat supplies. Last winter many smoke-houses were filled with ham, bacon, and sausage, from hogs fed and slaughtered at home. That the West is the granary and smokehouse of Georgia is less true now than for many years past. It has been many years since the agricultural interests of Georgia were in such good shape. The farmers have in the last 12 months made encouraging progress toward the goal of independence. Nor should we fail to mention the good peach crop of 1900, which, notwithstanding all hindrances, has brought good profits to some of our fruit growers. Although this crop, as a whole, did not prove as remunerative as early indications promised, yet the money it has put into circulation within our State entitles it to rank among the great new money crops of Georgia. It has paid during the dull season thousands of dollars to the laborers employed in gathering, packing, canning, and shipping the fruit.

"The sugar-cane industry of Georgia has also made gratifying progress. The growing of cane and the manufacture of sirup in south Georgia has doubled in the last 2 years.

"We predict that in the near future a number of sugar refineries will be established in south Georgia. These will give a wonderful impetus to this great industry. The more we add to the productions of Georgia the more will we increase the general prosperity. Therefore it is gratifying to note the possibilities which Georgia offers for the addition to her resources of another great money crop.

"Tobacco of the best grades has been successfully raised in several sections of the State, but seldom in greater quantity than is required to meet the individual wants. But more attention is being paid to this valuable crop, especially in south Georgia.

"We do not hesitate to declare that Georgia possesses possibilities for successful agriculture unsurpassed in the world. There is no reason why our farmers should depend upon any other country or section for food supplies for man or beast. The success of some of our most scientific farmers in wheat growing, raising as high as 40, 50, and even 65 bushels to the acre, gives convincing proof of our ability to raise our own bread supplies and have some for exportation besides. And when we come to food for stock no country has a better store of native grasses, with the additional advantage that the many foreign grasses so highly esteemed elsewhere will, with proper management, grow luxuriantly in Georgia soil and yield a handsome profit."

It is nothing uncommon for us down there to raise 4 tons of hay to the acre. It is very common.

Q. What is your main grass—Bermuda?—A. We have Bermuda, crab grass, orchard grass; they all grow there.

Q. What is your best haying grass?—A. It is usually crab grass.

(Reading:)

"In the new plan of cutting, shocking, and shredding the cornstalk by machinery we have a method far superior to the old one of pulling fodder and leaving the stalks standing in the fields.

"In the peavine, also, the farmers of Georgia possess the most nutritious hay, as well as a splendid renewer of exhausted soils and preserver of those that are yet in good condition. Even the cotton seed, once cast aside as useless, after enough for the planting of a new crop had been saved, supplies in its meal and hulls rich food for stock, and in its meal a superior article for supplying nitrogen to the compost prepared for fertilizing the soil.

"With all the advantages thus possessed every inducement is offered the farmer for raising meat for his own family and for the neighboring markets. At present the Western beef, by its superior quality, holds the field, even in the small towns crushing out local competition. All the money carried out of the State for the purchase of Western beef, mutton, pork, and ham can be kept at home for circulation among our own people if the Georgia farmer will pay more attention to the raising of stock. Considering the difficulties that have beset them on every side the farmers of Georgia have done well. For their long and heroic struggle of 85 years, and for the difficulties they have overcome, they deserve all praise. But the phenomenal success of some of our Georgia farmers has shown the marvelous possibilities within our grasp.

"One great need of our farmers is the formation of a farmers' institute or club in every county, in which may be discussed the best methods of agriculture, the latest and best machines for labor saving, and other things of interest and profit to the farmer. Industrial education is as necessary to the farmer as to the mechanic. Nature studies should form a prominent part of the curriculum of our public schools. From the kindergarten to the university the pupil should be taught to know something of nature's ways, and in special schools the farmer should prepare for his profession just as the physician, the lawyer, the preacher, or the mechanic does for his. This is a day of machinery, the proper handling of which demands education. Nowhere does machinery pay better than on a farm, provided it be wisely bought and judiciously managed. The West makes much greater use of farm machinery than Georgia. This ought not so to be. A farmer can no more afford to be behind the age than can a man engaged in any other business. In the physical as well as in the spiritual world growth is life, stagnation is death. Progress is the watchword of the farmers of Georgia, and progress is finding out the best methods and adopting them. What the farmer has learned for himself he is teaching his children at home and then sending them to school, where that education can be continued and enlarged."

Q. (By Mr. LITCHMAN.) Have you cotton factories in Georgia?—A. We have a few. They have been very successful. Our people have for years been wild and crazy on cotton. They have thought that everything they needed there could be bought somewhere else cheaper than they could raise it; but they are just waking up to the fact that they have been mistaken; that they can raise their own food supplies, and for this last 2 or 3 years they have been doing that. In that is the greatest change among our planters that I have seen.

(Testimony closed.)

WASHINGTON, D. C., March 23, 1901.

TESTIMONY OF HON. ROBERT RANSOM POOLE,

Commissioner of Agriculture of the State of Alabama.

The commission met at 11.15 a. m., Mr. Farquhar presiding. At that time Hon. Robert Ransom Poole, of Montgomery, Ala., commissioner of agriculture of the State of Alabama, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Give your full name, address, and official position.—A. Robert Ransom Poole, commissioner of agriculture of the State of Alabama.

Q. Now, take the first question in our plan of inquiry, the increase or decrease in number employed in agricultural labor in the several States in the last 50 years?—A. That is a very wide question, and one that I have no data hardly on which to predicate an opinion. In a general way I would say that we have an increase of at least 50 per cent engaged in agricultural pursuits during the last 50 years.

Q. What is the character of labor, what is the percentage of black, and what the percentage of white?—A. About 50 per cent of black.

Q. Of this colored labor is there a large percentage that are tenants, or do many of them own the property that they cultivate?—A. A very small percentage own their property. They are engaged in different modes of farming: Tenants, shares or partnerships, and the wage system, about 33½ per cent each.

Q. What are the terms of your sharing of crops? What does the owner of the land furnish, and what does the tenant furnish?—A. The owner of the land furnishes the land and the tenant house and all the teams and implements necessary to make a crop. The tenant furnishes the labor. The tenant generally gets one-half of the cotton and one-third of the corn and other crops raised by his labor. Frequently the landowner or landlord furnishes everything, and furnishes the tenant so many provisions, say provisions for 6 months, and the tenant gets one-third of the crop raised by his labor. In the wage system the maximum amount paid is about \$10 per month, the minimum about \$6, for farm laborers with their provisions and tenant house furnished.

Q. Are those wages in cash monthly or are they withheld for a certain time?—A. They are generally paid half cash monthly.

Q. Is there such a thing as a lien or a mortgage on the crop by written contracts between the owners of the land and the tenants?—A. We have in Alabama, I think, about 18 black belt counties and 6 or 8 of the other counties, not known

as black belt, say 25 agricultural counties, where this negro labor is worked, where the negroes rent the land from the landlord; generally there is an advance by merchants in the villages and towns, and where that is the case they take a mortgage on the growing crop for supplies furnished the laborer or tenant.

Q. Do these owners of lands there usually make an arrangement under the contracts with stores for the supply of food, etc., to these tenants?—A. That is frequently done.

Q. Do you know what rates those tenants usually pay for supplies?—A. They pay a small per cent above the cash price, whatever the price may be, and along that line their conditions are improving very much. The transportation has improved in our country, and provisions and everything of that sort have been steadily growing cheaper all the while. Competition has been increasing also, and consequently has forced down the price of provisions, and the conditions have improved along those lines very much.

Q. You do not know of any extortionate rates of interest that are charged, do you?—A. No.

Q. Or profits on this class of supplies to the tenants?—A. No.

Q. You speak of the black belt. What are the principal agricultural industries in that black belt?—A. There are 18 of those black belt counties going across the State from east to west. The soil generally is black, and the population in a large measure is colored. The negroes out vote the white people of that section 5 or 6 to 1, and that section is known as the black belt of the State of Alabama. The southeastern portion of the State is engaged in agricultural pursuits also, but that is inhabited by a class of white people that are very thrifty farmers, and, in fact, the most intelligent farmers in our State. They are farming generally on the intensive plan, and they do their own work; they are small farmers generally. In this black belt section the lands are owned in large tracts by white men, and frequently a man will work from 50 to 150 hands or tenants on his place. I have several plantations of my own. On one place I work about 65 hands, and on others a lesser number. The land is held in that section in large tracts of from 320 to 2,000 acres generally. In the eastern and southeastern portions of the State the land is held in smaller tracts by the white farmers.

Q. What is the general condition of the colored man in this black belt compared with his condition in the other sections of the State?—A. He is well fed and well clothed; he is peaceable and law abiding and well adapted to the growing of anything. The South seems to be his home. The colored people there come in contact with a class of white people who owned them when they were slaves, or their descendants. We have no labor troubles at all, and have never had any. They are obedient and respectful, and we have no trouble whatever with them.

Q. You have, then, very little migratory labor in that black belt?—A. Very little.

Q. Nearly all born and raised in that section?—A. Largely born and raised there.

Q. Are there many of these colored people who have moved from that section either into Mississippi or elsewhere?—A. Not of recent years; but there is a disposition among the younger negroes to go to the mining districts on account of higher wages. We are just south of the Birmingham mineral district, and in many instances the younger negroes go there. But they always come back. They go there and work a few months and generally drift back to the plantations.

Q. You say then that this black belt is chiefly agricultural?—A. Yes; entirely so.

Q. What changes have occurred in agriculture there in the last 10 or 15 years?—A. Very few. We are not very progressive there, but the conditions are improving.

Q. Are you chiefly in cotton raising?—A. Entirely in cotton and corn; very few other products are grown there.

Q. You have not then very much diversified agriculture in that section?—A. No; very little. I am endeavoring to bring that about through my department of agriculture. I am encouraging that in every conceivable way.

Q. Just state to the commission what are your propositions in Alabama as to the diversity of products and how far you have progressed and what the State has done to encourage it, if they have done anything?—A. I do not know that we have any plans, or that the State has done anything. Do you think, Mr. Adams, we have? I would like to have you assist me.

Mr. ADAMS. We have spent a good deal of money for the different seeds this year.

The WITNESS. Oh, yes; we have through our seed department distributed quite a large number of seeds, supplied seeds of every kind. I can say that our agriculture is improving all along the line in Alabama. The department of agriculture in Alabama, I will state, if you will allow me is supported from a tag tax.

Every ton of fertilizer sold in the State of Alabama pays to the State of Alabama a tax of 50 cents a ton. The manufacturer before offering his goods for sale applies to the commissioner of agriculture for tags, and we supply those tags to him at the rate of 50 cents a ton, and he, before offering his goods for sale, files with us an analysis of his fertilizers, showing the constituents composing them; and those goods are sold to the farmers by dealers throughout the State. At the college at Auburn is located the State chemist, and we have there analyzed all the fertilizers offered for sale in the State, thereby securing to the farmers the genuine article of the goods offered for sale.

Q. This tag tax is a State tax on the sale of fertilizers?—A. Yes; on the sale of fertilizers.

Q. And does it carry a warranty of the genuineness of the fertilizer?—A. Yes; every sack of fertilizer has the statement of an analysis on the bag showing its component parts.

Q. When was this school at Auburn first founded?—A. Mr. Adams, do you know? It has been in existence quite a number of years.

Mr. ADAMS. It has been in existence about 30 years.

The WITNESS. Yes; about 30 years. But the department of agriculture has been in existence only about 12 years.

Q. How many pupils do you have in this school? What is the tuition and what is the class of studies that are pursued there?—A. They have about 425 students. It is an agricultural and mechanical college, and agriculture in all of its branches is taught. We have an experiment station connected with this school also, which is in charge of a professor of agriculture. The tuition is nothing, but the students pay their own board. It is absolutely a free school. I think there are some incidental fees of perhaps \$10 or \$12 a year to each student. We have 9 district agricultural colleges in our State, one located in each Congressional district, that draw from my department \$2,500 a year, and then we contribute also to two colored agricultural schools, one located at Tuskegee, Booker Washington's school, which is doing a very fine work in Alabama, and another located near the city of Montgomery, under Professor Patterson. We contribute to those schools from my department. We will sell this year from my department about \$100,000 worth of tags. The receipts from the tag tax is steadily increasing year by year.

Q. And this amount of revenue is expended entirely in what line?—A. It is covered into the treasury. It passes through my hands. I have an expense fund allowed me of \$500 a month for holding farmers' institutes, the purchase of seed, etc.

Q. (By Mr. KENNEDY.) I want to ask you if you can raise in Alabama your own corn and pork and other provisions, and if you do raise them, and if not, why not?—A. We can raise in Alabama everything that grows in the agricultural line. We have soil adapted to the cultivation of corn, and I suppose in our State we would make an average of 15 or 20 bushels. In the black belt they make as high as 40 or 50 bushels, but, of course, it will not average that much. We ought to raise all the corn and the pork that we consume, but we do not do so for the simple reason that we are cotton crazy down there. After the increase in price of cotton directly after the war, every farmer went into raising cotton, thinking there was more money in the production of cotton than in other products, and neglected the raising of pork and corn; but the decrease in the price of cotton forced them back to raise more corn, and now we are raising nearly all we consume in my State.

Q. A number of Southern representatives have complained that the South has to ship in corn and pork and other provisions that they could raise themselves.—A. Yes; that is a fact.

Q. And it is to the interest of the South to raise them as much as cotton, possibly?—A. Yes; that is a fact. That is the fault of the individual more than anything else. There is no farmer there, I do not care how poor his land may be, that can not raise all his home supply if he would do so. It is very much with the individual.

Q. You said, I believe, that you were encouraging the diversifying that would bring this about?—A. Everything that we can do from our department is being done; we are encouraging the diversification of the agricultural interests of the State.

Q. (By Mr. FARQUHAR.) How frequently are your farmers' institutes held?—A. That depends. As often as we can hold them. During the winter months, of course, we can not get the farmers together, but I shall try to hold them once in every 2 weeks in different sections of the State. We are assisted in that by the professors of agriculture and chemistry, and veterinary surgery, etc., from the department at Auburn, and as the chief or as commissioner of agriculture, I direct the holding of those institutes largely.

Q. What immediate interest do the farmers take in those institutes?—A. Considerable. They are very generally attended.

Q. Are there participants in any discussions there or questionings, or the production of papers on agricultural subjects by the farmers who attend, or is the programme entirely left to the teachers?—A. Yes; to the teachers generally, but we propose along this line to hold institutes and encourage them among the farmers. In holding these institutes I am going to invite progressive farmers over the State to go with me, and I am going to encourage that feature in the holding of our institutes in the future. I am, comparatively speaking, a new commissioner of agriculture, and consequently I have not held a great many institutes, but my work will commence along that line as soon as I return to Alabama.

Q. Are there many of your farmers there just simply owners of lands, or have they practical knowledge themselves as to diversification, as to cropping and as to marketing?—A. Yes; our farmers generally own their own lands, and as a class the farmers are very intelligent. In the black belt you will frequently find a graduate of Yale or Harvard college, living on his estate directing perhaps himself or by one of his sons or by an overseer the cultivation of his plantation. Then in the sandy land counties—we have two distinct sections—there are the smaller farmers, and as I remarked some time ago, they are more progressive than our larger farmers. The colored laborer is hard to teach in the use of improved methods of agriculture; consequently we are pursuing very much the old system inaugurated a number of years ago by our fathers and grandfathers in many instances.

Q. Is there much introduction in labor-saving machinery in your section?—A. Yes; we are beginning to bring in new machinery very generally. A number of years ago all the cotton was sown by hand; now we use the cotton planter entirely. Our oats and wheat (we have very little wheat in the southern part of the State but some in the Tennessee Valley) were cut with the old-fashioned cradle; now we use the McCormick binder and reaper there generally. We have dreamed of a cotton picker, but so far we have not been able to obtain anything that is a success. We have numerous labor-saving machines, such as cultivators. Different cultivators are generally used by the farmers, and the cotton planter and the stalk cutter, and we clean our lands with improved stalk cutters, etc. Our farmers, by the leaving of the younger labor for the mining business, are forced to resort to these labor-saving machines to supply the deficiency thus caused; but so far we have had an abundance of labor to meet all demands. I do not know what we will do perhaps in the future, but so far we are having no trouble.

Q. What is the condition of farming in your white settlements where the small farmers and the poor whites are?—A. Among those east and sandy land counties the small farmers are, as a general thing, prosperous, and they own their land to a very large extent.

Q. Have they equally with the colored men acquired lands since the war?—A. More rapidly. The negro is roving, is migratory in his disposition, and moves from plantation to plantation. One year he will move away to get more pay, and then go somewhere else, and the next year he will come back to where he started from. The white farmer is very much more stationary.

Q. Is it the colored man or the white man that takes up your mechanical trades?—A. I believe it is the colored man; is it not, Mr. Adams?

Mr. ADAMS. About equally divided.

The WITNESS. About equally divided. The white man is going more into mechanical trades, but, you know, we are rather a peculiar people.

Q. I wish you would explain the peculiarities; that is what I am trying to find out.—A. Before the war those negroes were the slaves of the owners of those lands I have described to you. On every plantation there were two or three carpenters, two or three taught the carpenter's trade by their owners, and every house was built by the owners of those slaves. Consequently, while a number of those old negro carpenters are still living, their numbers are decreasing and their places are being supplied by white carpenters generally.

Q. What has been the increase of your cotton mills in the last 10 years?—A. They have increased enormously; I suppose 75 per cent at least.

Q. What class of labor do you employ in your cotton mills?—A. Generally white.

Q. Have you exclusively colored help in any of the mills in Alabama?—A. No.

Q. (By Mr. KENNEDY.) Has there been a marked change in the attitude of the people of the South toward mechanical trades?—A. There is a very liberal disposition. Among the old aristocracy of the South there was a tendency or disposition to look down upon the trades, but that is gradually disappearing, and many of our best young men are going into trades. They are looked upon very favorably. I have a neighbor who has a son now at Lowell learning the textile indus-

try. He sent him there. He is a wealthy owner of a cotton-seed mill. That is one of the numerous instances I have heard of.

Q. (By Mr. FARQUHAR.) Is the incentive general in the South to young men to go into other business than agriculture?—A. Yes.

Q. And other than the professions?—A. I do not know about that. There is a great disposition among the young white men to leave the farms and go to the towns.

Q. Is there not the same disposition among the colored people to flock to the cities?—A. Yes; somewhat; because they are rather imitative. I have always had certain ideas along those lines. In many sections our public highways are miserable, and consequently it is hard to get around from neighborhood to neighborhood or from town to town. But in some of our counties we are now building good roads—macadam roads—and wherever that is the case the disposition is to go back to the farms. The lands have increased in value along these roads, and I think that is the key to the situation with us. The improved roads will have a tendency to encourage rural settlements.

Q. What do you think is the increase per acre in the worth of land for the last 10 or 15 years?—A. Before the war the lands in this section were worth anywhere from \$35 to \$100 an acre, but after the war they decreased in value very rapidly, and, in fact, for a number of years there was no demand for them at all. Our citizens were very, very poor, and we had very little money there. I suppose they went down to an average of \$10 an acre, but within the last 10 years our lands have more than doubled in value. I think that is a fair proposition. Lands which were 10 years ago worth \$10 an acre are now worth from \$20 to \$25.

Q. Are your large plantations breaking up into smaller tracts?—A. There is very little change along that line. The lands are held in large tracts, generally from 320 to 2,000 acres. If we could induce our farmers to sell off their lands in smaller tracts it would be much better for the country as a whole, but the person who owns a property that pays from 10 to 15 per cent on the investment is very loath to part with that investment.

Q. Are there any debts or mortgages on that class of property?—A. Ten years ago it was largely mortgaged, but the mortgages have been rapidly paid off, and there is now but a small percentage of those lands that are mortgaged. The mortgage debt of Alabama is decreasing very much. I should say there is not over 15 or 20 per cent of our lands mortgaged, not to exceed 25 per cent at the very outside.

Q. (By Mr. KENNEDY.) I would like to ask you if that is not one item of great interest to the people upon which the department of agriculture of the State ought to be able to give information?—A. I think that a very good suggestion. We have had rather an era of prosperity in Alabama for the past 10 years, and these mortgages have been paid off very rapidly.

Q. (By Mr. FARQUHAR.) A good deal of your prosperity in Alabama comes through minerals and manufacturing, does it not?—A. I have not elaborated on the mineral district; I have been speaking along the agricultural line. We are not as progressive as I would like to see our people in our agricultural districts, but there is an improvement along the line, however.

Q. What encouragement does your legislature give agriculture other than simply the establishment of your bureau?—A. We have the public lands that are open to settlement and some State lands open to the homestead laws. I think we give 160 acres to the homestead.

Q. (By Mr. KENNEDY.) Has the Government any lands to speak of other than swamps?—A. There are no very desirable lands now; they have been taken up. I frequently get inquiries along that line from different States. We have some swamp and overflow lands that are not desirable for agricultural purposes.

Would you like to hear about the timber districts of our State and ask me questions along that line? In the southern part of the State we have large quantities of virgin pine forests. The increase in the price of lumber has stimulated the building of sawmills all over the southern part of Alabama, and the people there are very prosperous—the timber people. They have made lots of money, and pine lands have increased in the last 10 years 100 per cent in value.

Q. What is your means of transportation through the pine lands, railroads or rivers?—A. Railroads principally, although we have several rivers, the Alabama, the Warrior, the Tombigbee, the Coosa, the Tallapoosa, and several other streams. But the timber generally is transported by rail.

Q. Do you say that the timber lands have been lately utilized?—A. The industry has been stimulated very much by the increased price of lumber. We have some of the finest pine lands in the United States, and Mobile is getting to be one of the largest lumber ports in the United States. We ship lumber from Mobile and Pensacola all over the world.

Q. What immediate interest do the farmers take in those institutes?—A. Considerable. They are very generally attended.

Q. Are there participants in any discussions there or questionings, or the production of papers on agricultural subjects by the farmers who attend, or is the programme entirely left to the teachers?—A. Yes; to the teachers generally, but we propose along this line to hold institutes and encourage them among the farmers. In holding these institutes I am going to invite progressive farmers over the State to go with me, and I am going to encourage that feature in the holding of our institutes in the future. I am, comparatively speaking, a new commissioner of agriculture, and consequently I have not held a great many institutes, but my work will commence along that line as soon as I return to Alabama.

Q. Are there many of your farmers there just simply owners of lands, or have they practical knowledge themselves as to diversification, as to cropping and as to marketing?—A. Yes; our farmers generally own their own lands, and as a class the farmers are very intelligent. In the black belt you will frequently find a graduate of Yale or Harvard college, living on his estate directing perhaps himself or by one of his sons or by an overseer the cultivation of his plantation. Then in the sandy land counties—we have two distinct sections—there are the smaller farmers, and as I remarked some time ago, they are more progressive than our larger farmers. The colored laborer is hard to teach in the use of improved methods of agriculture; consequently we are pursuing very much the old system inaugurated a number of years ago by our fathers and grandfathers in many instances.

Q. Is there much introduction in labor-saving machinery in your section?—A. Yes; we are beginning to bring in new machinery very generally. A number of years ago all the cotton was sown by hand; now we use the cotton planter entirely. Our oats and wheat (we have very little wheat in the southern part of the State but some in the Tennessee Valley) were cut with the old-fashioned cradle; now we use the McCormick binder and reaper there generally. We have dreamed of a cotton picker, but so far we have not been able to obtain anything that is a success. We have numerous labor-saving machines, such as cultivators. Different cultivators are generally used by the farmers, and the cotton planter and the stalk cutter, and we clean our lands with improved stalk cutters, etc. Our farmers, by the leaving of the younger labor for the mining business, are forced to resort to these labor-saving machines to supply the deficiency thus caused; but so far we have had an abundance of labor to meet all demands. I do not know what we will do perhaps in the future, but so far we are having no trouble.

Q. What is the condition of farming in your white settlements where the small farmers and the poor whites are?—A. Among those east and sandy land counties the small farmers are, as a general thing, prosperous, and they own their land to a very large extent.

Q. Have they equally with the colored men acquired lands since the war?—A. More rapidly. The negro is roving, is migratory in his disposition, and moves from plantation to plantation. One year he will move away to get more pay, and then go somewhere else, and the next year he will come back to where he started from. The white farmer is very much more stationary.

Q. Is it the colored man or the white man that takes up your mechanical trades?—A. I believe it is the colored man; is it not, Mr. Adams?

Mr. ADAMS. About equally divided.

The WITNESS. About equally divided. The white man is going more into mechanical trades, but, you know, we are rather a peculiar people.

Q. I wish you would explain the peculiarities; that is what I am trying to find out.—A. Before the war those negroes were the slaves of the owners of those lands I have described to you. On every plantation there were two or three carpenters, two or three taught the carpenter's trade by their owners, and every house was built by the owners of those slaves. Consequently, while a number of those old negro carpenters are still living, their numbers are decreasing and their places are being supplied by white carpenters generally.

Q. What has been the increase of your cotton mills in the last 10 years?—A. They have increased enormously; I suppose 75 per cent at least.

Q. What class of labor do you employ in your cotton mills?—A. Generally white.

Q. Have you exclusively colored help in any of the mills in Alabama?—A. No.

Q. (By Mr. KENNEDY.) Has there been a marked change in the attitude of the people of the South toward mechanical trades?—A. There is a very liberal disposition. Among the old aristocracy of the South there was a tendency or disposition to look down upon the trades, but that is gradually disappearing, and many of our best young men are going into trades. They are looked upon very favorably. I have a neighbor who has a son now at Lowell learning the textile indus-

Q. (By Mr. FARQUHAR.) You accept the statements of Mr. Adams as a part of your testimony, do you, Mr. Poole?—A. Yes; we endeavored 2 years ago to pass legislation to encourage the building of cotton mills in Alabama by exempting them from taxation for a number of years, but the bill looking to that end failed of passage. I was a member of the legislature at that time and was on the ways and means committee, and remember making an attempt to pass it.

Q. The repeal of the laws in respect to the hours of labor was made also as an encouragement for the establishment of mills in the South?—A. Yes.

Mr. ADAMS. In our State, now, the number of hours employed is usually settled by contract between the laborers themselves with the operators.

Q. Just an open bargain?

The WITNESS. Yes.

Q. What have you to say about your laws on the taxation of the agricultural property of your State?—A. I do not think they are excessive. There is no complaint along those lines at all. I do not think they are at all excessive.

Q. Have you a system of equalization of taxes?—A. Yes.

Q. Do you think that in the last 25 or 30 years there has been a decline in the productive quality of your soils?—A. No; the productiveness of our soil has increased by the use of fertilizers, etc. We have lands there that 25 years ago were not making a bale of cotton to 5 acres, and which are now making a bale of cotton to the acre.

Q. But, of course, that is under the force process of the fertilizer?—A. Yes; of course, where lands are not fertilized they deteriorate very much, but under the fertilizing system and intensive plan we have obviated that and are now making more cotton than ever before.

Q. What increase of acreage of arable lands has there been in the last few years?—A. I have no data as to the increase of this year over last year, but there has been a steady increase for years in the amount of land cultivated. What percentage, I can not say; a very small per cent, say 3 to 5 per cent.

Q. Has there been anything done on the part of the State or others, in the matter of the reclamation of your swamp and waste lands?—A. Nothing.

Q. They lay just as they are, subject to entry, I presume, on a small fee?—A. Yes.

Mr. ADAMS. Some of the lands are first rate. Some are swamps and are overflow, but a great deal of the land is good.

Q. You would say then that the condition of agriculturists in Alabama is much better now than it was 15 or 20 years ago?—A. Yes; by 50 per cent.

Q. That labor is also better provided for and receives better returns than it did then?—A. Better compensation; yes.

Q. And that labor is more stationary than it has been—less migratory?—A. Yes.

Q. Has Alabama suffered any from attempts on the part of colored men to have the colored people colonize and leave the State and go elsewhere?—A. There have been attempts made to carry them off.

Q. Have you any practical knowledge of the motives that control the men who have practiced these migratory schemes?—A. It was for the money they could dupe these individuals out of; for their own gain and not for the benefit of their fellow-man at all.

Q. Do you think there is any State in the South where your colored population could be better off than where they are now?—A. No; I do not. I think our State is peculiarly blessed in many respects, in climate and soil and in conditions generally.

Q. Have you observed much of an increase in the mental capabilities of the negro since he has received an education?—A. Yes; his condition is improving very much.

Q. Do you think it is possible for the colored man, up to a certain line, to improve in educational matters as much as the average white man in the South?—A. I find that the young negroes—the younger children are very ambitious to improve their condition, and their parents are anxious for them to do so. There has been a fear among the negroes for a number of years—and I expect they have good grounds for it—that some of these days we will have an educational qualification for suffrage. I think they have apprehended that, and therefore they have stimulated their children to acquire an education. They are very ambitious generally. I will state that in the agricultural districts among the colored labor the strike is unknown.

Q. (By Mr. KENNEDY.) Is there any sentiment in Alabama in favor of getting rid of the colored population of the State?—A. No. I think 99 per cent of the white people of Alabama are glad to have the negroes there. They are law abiding, comparatively. They will steal a little bit sometimes; but they make good farm laborers and good servants generally.

Q. Have you a compulsory crop contract law in Alabama?—A. Mr. Adams, what was the bill that passed through the legislature in regard to the breaking of contracts?

Mr. ADAMS. That was simply as with any other contracts, to make it a misdemeanor for any man to break his contract without proper notice.

The WITNESS. Frequently when we contract with our labor, and that is done usually the 1st of January, they sign a contract to perform certain labor. It is an agreement between the land owner and the tenant. We have very little trouble along that line, but sometimes we have a party that will run off and leave his crop, and in some instances he is prosecuted for the offense criminally; but that is very rarely done.

Q. Sent to jail if he breaks his contract?—A. If he obtains money by false pretense; but his intention is very hard to establish. I have never heard of a man being put in jail for breaking a contract there. Did you ever hear of one, Mr. Adams?

Mr. ADAMS. No; but I think this law makes it a misdemeanor. But under it, if he gives the party notice that he is going to break the contract, the penalty does not apply.

Q. There must be a cause for the enactment of such a law. It must be that the negroes are in the habit of violating their contracts?

THE WITNESS. It occasionally happens, but you have got to establish an intent to defraud before you can prosecute criminally.

Q. Do you find the negro has very little regard for the sacredness of a contract, or is he any different in that respect from the average white man?—A. I should say he regards it as less binding. He has less regard for his contract than the white man, and if he can better himself by going elsewhere, he does not care.

Q. (By Mr. FARQUHAR.) You said you had no strikes among agricultural labor?—A. We have none.

Q. Does not that arise from the fact that agricultural labor is so scattering it could not strike?—A. Largely.

Q. Is not that the reason all over the United States; the fact that agricultural labor is so scattered that it can not inaugurate a strike?—A. I think that is the fact.

Q. Have your people agitated the question of compulsory arbitration?—A. No.

Q. When you were in the legislature was that question ever brought up?—A. No. I think we have no law along those lines.

Q. No agitation for such a law?—A. No. Strikes have been very rare in Alabama. We have had only one serious strike in the mill districts, and that was years ago.

Q. (By Mr. KENNEDY.) What have you to say about the cost of making cotton and the profit there is in it to the farmers at present prices?—A. I remarked that for the last few years the production of cotton has been very profitable and our farmers have been stimulated to put an increased acreage in cotton.

Q. We know what a bushel of wheat can be raised for in certain sections of the country, and we know the profits. Have you any statistics as to cotton?—A. No; I have not.

Mr. ADAMS. Cotton can be made in Alabama for 5 cents.

Q. All above that is clear profit to the farmer?

Mr. ADAMS. Yes.

Q. They have secured a splendid profit with recent prices?

Mr. ADAMS. Yes.

Q. We have had men come here and say that it was one of the curses of the South that they did not diversify their crops and raise their own provisions; that they had a soil on which they could raise grain and other products, but instead of that they were all after cotton and brought their provisions in from the West.

THE WITNESS. Unfortunately that has been the condition in Alabama, but that condition is growing less apparent every year. Directly after the war, when the negroes were turned loose, they, having been slaves, did not know what to do with themselves. They committed depredations on the cattle and the hogs and stole them terribly and discouraged the farmers very much. But after a few years these practices subsided and confidence was restored. The people themselves went to work with some system, and they have been steadily increasing their prosperity every year since about 1890.

As a general thing the white farmers are more thrifty than the negroes. The negro, working for a part of the crop—the share cropper, as we call him—will draw on account probably 100 bushels of corn for his family. He will work 1 mule probably and will draw 150 bushels of corn and takes it and puts it in his crib. There is a country store near by, and if he wants a pound of coffee or a little sugar he sells a bushel of corn to get it; and generally by the 1st of March

he is out of provisions and has to go to his landlord for provisions, etc. Of course, the country merchant knowing all that, is going to sell at any price he can get, and he puts a very low price on the corn. It all goes on the market and gluts the market, and produce drops down below its real value, but as soon as it is out of the hands of the negro it increases in value.

Q. How about provisions and seed and implements that the country storekeeper furnishes to the croppers and planters?—A. The corn is generally bought by the smaller cross-roads storekeeper, and the advances are generally furnished by the larger stores at the towns and villages throughout the country. They are furnished as reasonably as could be expected where a man advances to the illiterate classes, as negroes are. The merchant is human and he takes advantage of those things and gets all the profit he can; but all these things have improved very much and the condition of the negroes has improved correspondingly.

Q. (By Mr. FARQUHAR.) Does the country merchant give credit on the indorsement of the owner of the land or does he take the cropper?—A. He will take a mortgage lien on the cropper's interest in the crop. He will frequently ask permission of the landlord. He will say, "Jim Jones wishes to get advances from me; have you any objection? No or yes. What amount do you think he will be good for?" He just holds him in on advances to a certain amount until the crop shows what it is going to do and then lets him go. As a general thing the negroes are improvident. When they make a settlement at the end of the year they go and buy everything they want—furniture, and guns, and horses, and wagons, and buggies, etc., and they generally get rid of their money very rapidly. If they were as economical as the white people they would absolutely own that country in a few years. It is getting so that in our section in the black belt the most of the lands are rented to negro tenants for the simple reason that they can afford to give more for them than the white man can. I own several plantations and I rent to the negroes because I can get more rent from the negro. He furnishes his own labor and can afford to pay more rent than the white man who depends on hiring his labor done can.

Q. (By Mr. KENNEDY.) What rates do you have to pay for money there?—A. Our bank facilities have improved very much in the last 25 years. Take my county, which is one of the richest in the State, I think it ranks fourth in productiveness. There was only 1 bank in the county 25 years ago, and at that time the farmers borrowed their money from commission merchants in Mobile and Selma, and would pledge the shipments of their cotton to those merchants. Now we have in our county 6 banks, and any farmer who is good and known to be a debt-paying man can go to any bank and give a note for what money he needs at 8 per cent. Frequently money is loaned for less, but the legal rate is 8 per cent.

Q. Is not 8 per cent a pretty high rate when we consider that we are almost on a 2½ per cent basis?—A. I have seen men pay 20 per cent down there. We have a wonderful recuperative country. I have known farmers to make a complete failure in their crops—some fellow running a plantation. He will be sold out by his commission merchant. Some one will get sorry for him and loan him, say, \$1,000 and he will pay him back the first year, and the second year he will be on his feet again.

Q. How many of your banks have been started recently?—A. Five out of the 6 have been started in the last 10 years.

Q. How many in the last 2 years?—A. One.

Q. All national banks?—A. Three are national and 3 private banking institutions in my county. I will state for your information that the cotton-seed industry has greatly improved in our country. I remember 10 years ago, when we had no mills, cotton seed was worth 10 cents a bushel. I have a friend, a neighbor of mine, who has several large plantations and makes about 1,200 bales of cotton. He built an oil mill last year at a cost of \$40,000, and he made \$40,000 profit in the first year, paying for the mill. The dividends of every mill in the State of Alabama have not been less than 40 per cent in the last 2 or 3 years. They have earned enormous dividends.

Q. That makes cotton raising all the more profitable?—A. Yes. The average price of cotton seed in Alabama last year was 80 cents a bushel. You can see the difference over 10 years ago, when the price was 10 cents.

Q. (By Mr. FARQUHAR.) How about fruit raising in Alabama?—A. We are encouraging that industry, and in our last legislature a bill was introduced to prohibit the importation of infected fruit trees. Fruitdale, on the Mobile and Ohio Railroad, near Mobile in Washington County, shipped about 80 carloads of peaches to Chicago last year. They will ship 200 carloads this year from that one place.

Q. Peaches are being developed, particularly as a crop?—A. All fruits do well, particularly peaches. Then we have quite a wine industry developing in our

State—grape growing. We have two grape-growing towns. The town of Cullman is settled by Germans and Bavarians, who came from the old country. There is not a negro in it and there is not a single individual negro in the county. They are entirely German farmers there. That is one of the most prosperous counties in Alabama. They raise everything in the world. I had occasion as the commissioner of agriculture to send my agents to that county and find out what was grown. They raise farm products of every description.

Q. Have you any immigration of farmers into your State—white farmers or foreigners?—A. Very little.

Q. Do you give any encouragement to immigration?—A. Nothing but the homestead rights. We have another place where the grape industry is prosperous, the town of Claiborne. That is settled by people from the Northwest and by Scandinavians. They are growing grapes on about 6,000 acres and are doing very well, indeed. They make several different kinds of wine, and it is very fine, indeed.

Q. Do you think of any general statement that you want to make further?—A. No; except this: I regard Alabama as the most rapidly developing of all the Southern States. Her minerals, her timber, and her agricultural interests and conditions are improving. We have a fine and healthful climate, plenty of water, rich soil, and if our negro labor was a little more intelligent we would be able to use all the improved farm implements. The ignorance of the negro is one great bar to our success. They are much prejudiced against any new ideas.

(Testimony closed.)

WASHINGTON, D. C., April 12, 1901.

TESTIMONY OF MR. M. F. GREELEY,

Secretary of the Board of Regents of Education of the State of South Dakota.

The commission met pursuant to recess at 2.35 p. m., Mr. Farquhar presiding. At that time Mr. M. F. Greeley, secretary of the board of regents of education of the State of South Dakota, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Please give your full name, your residence, and your occupation or profession.—A. M. F. Greeley, Gary, S. Dak.; my business is stock farming.

Q. How long have you been a resident of South Dakota?—A. Between 18 and 19 years.

Q. Where were you farming before going to Dakota?—A. In Waupaca County, Wis.

Q. (By Mr. A. L. HARRIS.) What official positions, if any, are you holding at the present time?—A. I am a member of our board of regents of education and secretary of the board. I am also the editor of the *Dakota Farmer*, the leading farm paper of the Dakotas. I have been for 4 years engaged in farmers' institute work, and for 2 years past have been conducting farmers' institutes in the State of Minnesota and doing some institute work in my own State and in North Dakota.

Q. In your institute work have you been pretty generally over the States of North and South Dakota and Minnesota?—A. Yes; that is, particularly as to Minnesota. I have been all over that State several times in my institute work there and in my own State and North Dakota. I am pretty generally acquainted as an institute man and also as one engaged in the sheep and wool business and general farming.

Q. As a stock raiser, are you engaged in any special line of stock?—A. I have made mutton growing a specialty for about 21 years and have done other things in connection with it, but that has been the leading part of my work.

Q. How extensively are you engaged in sheep raising?—A. I have from 300 to 500 head on my farm as a rule, according to the time of the year, and whether dealing in sheep or not seldom carry fewer than 300 to 400 ewes on the farm.

Q. Are you conversant with labor conditions in the States that you have mentioned?—A. As applied to farming, I think, but not otherwise.

Q. Please state the condition in those States compared with other labor and former conditions.—A. Our average hired men are not quite what they used to be; for some reason we do not get as good men as we did. They are determined to work fewer hours, though they are paid better wages than we used to pay them, or that I used to get when a hired man myself. I think one reason for this change

is the improved machinery. We have introduced so much of that that the work really gives them very little steady employment, as a rule. They can not rely upon employment the year round, and so those who like to have employment steadily go into other things more.

Q. You assign as one of the causes the irregularity in employment?—A. I think it is; the irregularity of employment and not having work the year round.

Q. What are the hours of labor a day in your section of the country?—A. We do not pretend to work a man much over 10 hours, even on a farm. The men seem to expect to work about 10 hours, though there are seasons—haying, thrashing, and other times—when they have to work more.

Q. How many days are they employed in the year?—A. We generally hire men about from 6 to 8 months, more often 6 months than 8, and the bulk of them are hired by the day or short terms through harvest or haying and other busy times.

Q. Is there any tendency on the part of your labor to seek other employment?—A. There is, on this very account, that they do not have steady employment, and this, too, tends to make them anything but thorough, and for this reason we prefer foreign people, as a rule. If we want a good shepherd, we generally try to get a Scotchman or an Englishman. Next to the foreign help we like help from Canada. Help from all these countries seems to be more thorough than our own. They seem to expect to do something for what they get and to do that thing as it ought to be done. They have made a business of mastering some kind of work, and they are proud of it. But our help here does not seem to know anything thoroughly; as a rule, they are masters of nothing, but do some things fairly well, and for that reason they are not the best help, though some are the most capable and intelligent help we have.

Q. What wages do you pay?—A. We are paying now by the month through our country, and largely in Minnesota from \$20 to \$25 a month. It is about \$4 or \$5 higher than it used to be 8 or 10 years ago on an average. Many pay No. 1 hands, tried and reliable, more than this. That includes, board, lodging, etc.

Q. What wages do you pay where you furnish the tenant a house?—A. That depends upon what you furnish besides the house. By the way, this seems to me one of the very best ways of getting reliable labor on the farm. There are a good many things to be said about it, and nearly all in its favor. I could mention a few if you wish to have me. When we employ a single man he is liable to go or change at almost any time; we can not depend upon him nearly so well as we can upon a man who is married, particularly one who has a small family. Then he stays with us willingly the year round. If he has children they have an opportunity of growing up in the country, which means a great deal to children in this country and in these days. Again, his family are valuable help in trying, busy times in the farm work. It is much more convenient for the farmer to employ them than it is to go after other help when he needs it, and perhaps pay very high for it, too, if he needs it but for a short time. Again, he does not have to pay all cash. He can give the tenant farmer a good garden and not feel it at all. He can let him have the use of one cow and not feel that very much, but these things mean very much to a man with a family to feed. Often if he can, in addition, be provided with vegetables and other truck, he can almost live out of what the farmer can give him without missing it on an ordinary Western farm, and still make better help than the man without a family. This is almost the solution of our hired help problem out there, to encourage the tenant hired man with a wife and children.

Q. Has he any advantage over the laboring man in the city or town?—A. Yes; very decidedly. If he has a small piece of land to cultivate he is learning to make bread and butter for himself—learning the great trade of how to get a living out of land. If he has children it is also so much better for them to live in the country; it is so much freer and so much more wholesome and more secure for them. They are more than twice as apt to make strong, self-supporting citizens than if grown up in idleness and crowded in with others in cities. Such a man can lay up more money than the one employed in the city at much higher wages. He can lay up all his wages, excepting, perhaps, a little with which to buy clothing. I know of cases where men who are prudently inclined, whose wives work with them to make a home, who are laying up all their wages. They have a little flock of chickens, which pay the grocery bill, and have possibly two cows. These almost supply the family. I know several families which sell enough butter and eggs in this way to furnish all the clothing and living, and have even more than the wages to lay up at the end of the year. This kind of living and "getting along" also engenders a wholesome independence and self-reliance, which direct wages never can.

Q. Do such persons become owners of land?—A. Almost invariably they do. If there is anything in them they soon see the advantages of having a piece of land

that they can back up on, and from which the world can not drive them. They learn how to cultivate that land, and the children have tastes along that line and experiences, too, which are invaluable to them, and when they get onto a piece of land they are at home and twice as apt to succeed as a man who comes out of the city and knows nothing about the business. It is a wonderful education along a most valuable line and costs them nothing. It is a lack of this very education which so frequently wrecks the beginner on land.

Q. Do they make good farmers and intelligent citizens?—A. Almost invariably. There are very few localities now that I know of where there are not men who have graduated in this way onto a piece of land and into first-class farmers.

Q. Have you personal experience of the things that you mention in regard to the conditions that you have spoken of?—A. To quite an extent. I began as a hired man on a farm, worked for 5 years on farms as a hired man, on both small farms and big ones, and in that way I became pretty well acquainted with these conditions. Then I began with a small piece of land and made a living for myself and family.

There is one more thing which is well worth considering in this connection, and that is help in the farm house. As a rule, unless there are grown-up daughters, there is little help outside of the wife and mother in these homes, and principally because none can be had. Very frequently the wife of the hired man, who is furnished a house and garden, can be induced to help in trying times, and is glad to do so. In this way she frequently and cheerfully earns a few dollars of her own which she can devote to little things and fixings she very much desires but would never think of taking money for out of the hard-earned wages of her husband. The growing girls of such families can also most generally be induced to help at the farm house when needed, when they might think it out of the way to hire out regularly to a strange family. They may, in this way, not only greatly accommodate the overworked wife at the head of the farm house, but may, by the training and experience, become tiptop little housekeepers, cooks, etc., before they are women grown. We have repeatedly seen this thing work greatly to the mutual advantage of both help and helper.

Q. Have you any such thing as crop sharing in your State?—A. We have a little, but not near enough of it, not nearly so much as I think we are going to have, as we are looking into the merits of that way of interesting labor in a number of occupations. The outlook is very promising.

Q. You may give some of the advantages of crop sharing and partnership.—A. I have not had much experience along that line myself. What I know of it is mostly from observation. In my own case my experience has consisted in letting sheep out on shares, as we call it. I find that I can let out a flock of sheep and give a man two-thirds and get more money out of them than I can to let him have them and give him only one-half. When his self-interest is developed, he turns into a better man, a better sheep man, and a better farmer. He will get more wool and more mutton, get more out of his work and work to better advantage. And so it is in crop sharing. There is a great big thing here for those who have large land interests they can not oversee themselves. I think it is better, however, to give the one employed a little cash, crop or no crop. It is better to do this in order that they may feel sure of something; if they can have that, and besides, a slight interest in the proceeds, it gets them interested and they do their very best without urging or overseeing. It is easier working hard when one is interested in the business and its income.

Q. Are many of your people foreigners?—A. Most of our hired help are foreigners, and a great many of my neighbors are Scandinavians or Germans. I am sorry to have to say it, for I am a New England man myself, but in holding our institutes in Minnesota, and they were large ones, averaging about 557 people to the institute for the year, where our audiences were made up largely of Scandinavian people, with perhaps a good sprinkling of Germans and Canadians, we found them its most intelligent and the best farmers—that is, the most practical and thorough ones. Judging from the questions they asked, the interest they took in the business, and the quality of stock they showed us, and the kind of improvements they were making, they were right at the front. This, of course, was in the older sections, where they have had opportunity to become Americanized very thoroughly. There we find our best farmers as a rule, and there we find our best hired men.

Q. Are they intelligent and prosperous?—A. Very intelligent and almost invariably prosperous after they once get the run of the country. Some of them when they first come here, of course, are not in position to take advantage of the country. It takes time for them to get well acquainted with it, and with our language, ways, and customs.

Q. Do they become landowners?—A. With scarcely an exception those whom I come in contact with do. They seem to know what it meant to have a piece of land in the old country, and what it meant there to be caught without a piece. They see the old country conditions crowding in upon us here, and they seem determined not to be caught a second time without a piece of land in an overcrowded country—and they are setting our young Americans a mighty good example in this respect.

Q. Has a greater percentage taken lands than among our native Americans?—A. Oh, yes. The American boys as a rule seem to think they can always get land when they want it, but the foreigner sees plainly that it is going, and that to be sure of it he had better get it before it goes. And that is where he is right. It is pretty hard to get our American boys to become interested in land, although we find a tendency, particularly among our Minnesota farmers and their sons, to stick to the soil more than they did 10 years ago; very much more. It is encouraging, decidedly so.

Q. Is there any disposition on the part of your foreign residents to colonize or to get closer together to preserve their language and habits?—A. There are communities inclined that way, and they are the slowest to Americanize and the slowest to adopt our methods, and they do the poorest for themselves as a rule, but this way of doing is not general. The better class of them prefer to be blended with Americans, and they get a great deal of good out of us, and we get a great deal of good out of them. It is a mutual benefit to come together—we can learn much from them. Where they colonize it goes against them and the country they are in.

Q. What effect has the immigrant had upon agriculture in your section of the country?—A. He has been a godsend to it. The people that have come to our country from Scandinavia, from Germany, and from Canada have greatly helped the agriculture of the Northwest. In some sections to take them out of it would nearly ruin the country. As a class, the Americanized Scandinavian makes the grandest citizen in the Northwest.

Q. Have you any suggestions to make in regard to immigration?—A. I do not know that I have. I believe in letting those who appreciate land have it. I am sorry to see them taking the very best farming land and our American boys drifting into the cities to uncertain and overcrowded occupations, but being sorry does not help it. If our boys prefer to be the hired men and renters of foreign landowners, as they surely will be in the near future, to being independent landowners themselves, let them take their bitter medicine. These landless men love land and understand how to take hold of it; and if they do, and our boys do not, I am glad to see them coming. I would encourage everyone who has no land to come while he can get it and then to cling to it.

Q. (By Mr. CLARKE.) What kind of an idea do you think it would be for the Government to undertake the distribution of immigrants into the agricultural regions, thus preventing congestion in the cities and helping the country?—A. I think if it could do it so as to make the distribution rather general, and not colonize them, it might work well. I should think if anything could be done along that line it would be a mutual benefit for the country and the people you put out there.

Q. Is there sufficient demand in the farming districts of the West for this labor, so that in case the distribution came you would find good places for the immigrants?—A. I think any sober, land-loving man that wanted to have land eventually himself, and who had a little experience in country life, or in farming or stock raising, would have no difficulty at the present time in working into steady employment. I do not think you would have any difficulty in placing about all of that class of people that could be brought into the country.

Q. (By Mr. A. L. HARRIS.) Have you land sufficient yet unoccupied to accommodate a large number of immigrants?—A. Our land is nearly occupied, in the way we use the word "occupied;" but all too often one man has too much in our country, and when he has a great deal too much it is a self-regulating affair. The superabundance will generally ruin him, and then that land will be distributed properly. But when one has not enough to ruin him, and yet has too much, of course, there is another question. When we can get our farms smaller we can take care of a great many people; we can double our population and still be better farmers for it, and more than double the yielding capacity of the land. And, besides, we have a good deal of open land yet, of course.

Q. What is the condition of your public schools as to equipment, schoolhouses, etc.?—A. We are well supplied; if anything, oversupplied. Including our State institutions, and the church institutions, and the ordinary public schools, we have really more schools than we need in many sections of the West just now.

Q. Is the school curriculum sufficient for the wants of the farmers?—A. That is a great big question. I think we are getting too much, if anything, of what we call book learning. That is a hard thing to say in these times, I know, but just the same I feel, and so do a great many, that we are getting too little of the practical in our schools. Too many of our boys and girls leave home and are educated and come back onto the farm, if they come back at all, full of facts and figures but with no muscle—mental, moral, or physical—with which to take hold of the business end of life. The bread and butter part of it is neglected, and they are sometimes almost helpless just as we consider them perfectly educated. I think if there were some way to work a little more of the practical into them—if our girls could know more about housekeeping, cooking, nursing, etc., which now so many of them deem unimportant, in fact, look upon as something beneath them, and if our boys would learn something of how to handle, breed, and feed stock, and how to take care of land to get the most out of the soil and still enrich it by crop rotation, thorough tillage, and that sort of thing—I think it would greatly benefit them. I see the need of this change very much in my work as an institute worker and as a farmer, but I can not tell you how to secure the change. The practical part should in some way be worked in with the other part so that each will make the other more available.

Q. Do you feel your institute work is having a good effect in that direction?—A. Yes; I am sure of it. I can take you into communities where we have held institutes, and right across the line into another State where they have not held them, and where they have held them I can show you better stock, better-handled stock, better-tilled fields, and better-handled crops. I believe I can show you all that and more. I can show you more contented farmers, and more boys and girls who are satisfied with, and proud of, their independent farm home life. As for farmers' institutes, Minnesota is the leading State in the Union, showing much the largest audiences and a correspondingly advanced condition of agriculture.

Q. Is there a local interest taken in your institutes?—A. There is, particularly where we have had them before in such places. We almost invariably have large crowds. Frequently the largest hall or opera house can not seat them. Last winter, as I said before, we averaged over 550 attendance in the institutes held throughout the State, including both thin and thickly settled sections. Minnesota employs in these institutes the best and most practical speakers to be found. It seems to be very difficult to get institute workers of the right type; that is, men who are clean cut speakers on subjects the farmers are interested in, and who have a practical knowledge of what they talk about.

Q. Have you an agricultural course in your agricultural college in South Dakota?—A. Yes; we have what we call an agricultural course, but I am sorry to say that I find that there is a tremendous tendency in most Western agricultural schools to make universities of them almost to the extent of disposing of good blooded stock to establish chairs in Greek. I do not know why that is, but as soon as even what seem good, practical men are put into these places they seem to get after the education part of it so strongly that they forget the practical, and the tendency is to turn them into schools and to make scholars and not farmers of those who go there. That is something we have to meet, and it is a hard thing to meet. The best—the very best—agricultural school on earth for a boy is to spend a year with a thoroughgoing, up-to-date stockman and farmer; to live in daily touch with first-class feeding, breeding, and handling of stock, with No. 1 tillage of the soil, rotation of crops, and the most advanced methods of making and conducting a first-class farm home. This being true, and I do not believe any practical, progressive, and consequently successful farmer will dispute it, the nearer our agricultural schools can come to this—to giving a boy this kind of a life and training—the more successful will they be. Those interested in our agricultural schools must not forget that a university is one thing and that an agricultural college should always and forever be another. I think, too, that all girls' schools—agricultural or otherwise, and particularly all normal or teachers' schools—should never permit a girl to go out from them till she is a thorough housekeeper and cook and well acquainted with plain nursing, and trained to regard these things as among the highest womanly accomplishments.

Q. Have you any further suggestions to make to correct the evil in the schools?—A. I would, as far as possible, work into the various chairs and into the presidency of such institutions practical, successful stockmen and farmers, even if we had to overlook a little more Greek and Sanskrit in their education. The tendency is now to do the reverse. I would do this to start with, and then, if possible, they should be held by the Department here in Washington in some way, right down to agriculture and stock raising, and it should be high treason for anything else

to be let in. If a little is let in all goes, and the student goes into anything but farming.

Q. (By Mr. FARQUHAR.) Would you say that agriculture is simply an optional study in your schools?—A. In some schools it is pretty nearly in that shape, I am sorry to say.

Q. (By Mr. A. L. HARRIS.) It has been advocated before this commission that nature study in the common schools would be a very helpful departure under present conditions. What would you say to that?—A. If nature study is brought into the schools, it is just like bringing agriculture and domestic science into them; it must come in in a very practical form, or it might as well be kept out, and we will have to be very careful whom we employ to teach it. If we employ the wrong person I do not know as it is going to help very much. I do not think it is possible to do very much in this line, but I am glad to know it is coming, and sincerely hope something may come of it.

Q. Have you had much to do with the agricultural college of Minnesota?—A. No; though I had a son there for a time. They are having the same trouble that we are, but still not quite so much so for this reason, perhaps. In our State and others referred to the State university is in one town, the State agricultural school in another, and so on all around; but in Minnesota all are together. This is also true in Nebraska, and for that reason, principally, I think they are a little ahead of us in this respect.

Q. What is the condition of the experiment station in your State?—A. It is doing very hard, thorough work, but largely along lines of little practical value to a large portion of the State, owing, principally, to the fact that it is situated in the extreme eastern part of the State, where there is nearly always ample moisture, and, notwithstanding what land agents and boomers may say, this is not true of nearly two-thirds of our State. We have moisture enough there for certain kinds of stocking and farming, but not like the eastern section.

Q. Is the experiment station looked upon as being valuable by the farmers?—A. By many, and still there is not just the right kind of a feeling toward it by the farmers of the central and western part of the State, particularly that section which, owing to the conditions mentioned, has to turn strictly to stock raising, and I must say that in my judgment that part has just cause for complaint. The school is in the southeast corner of our State in a section of the country very much like Minnesota and Iowa. The experiments are similar to those being carried on in Iowa and Minnesota, and they are of value to that part of the State, but they have very little connection with, and are of very little value to, the larger part of the State; nor is this the fault, to any great extent, of those in charge. If it would not be out of place, I would like to say just a word upon this point; that is, the possibility that there might be a little more elasticity in the interpretation of the law governing the appropriation. Now, we have \$30,000 or \$40,000 sent by the Government, in addition to what we receive for our agricultural school, for this experiment station, but that money benefits two-thirds of our State but very little. Secretary Wilson tells me that he is restricted in reference to the station at Highmore—a drouth-resisting forage substation which we have established to look after the interests of the drier sections of our State. They are conducting experiments there for drouth-resisting forage plants only, those that are supposed to grow without any irrigation, and we are unable to get any money from that experiment fund, although it is a very large one. I talked in person with Secretary Wilson and he told me he would do all he could for the Highmore station, and that he would, if possible, divert some funds to it, but afterwards he said he could not do so, owing to some rule or ruling. Now, it seems to me there might be some more elastic law or ruling whereby they could divert sufficient funds to this drought-resisting forage plant station to make it effective. It seems to me, and to the stockmen of the State, by far the most important experiment station of the two. It is a most vital question to our people how to get drouth-resisting forage crops. It means everything to fully half our State—very much to nearly all of it.

Q. Upon what authority have you established a substation of your experiment station?—A. Several years ago I introduced a measure in our legislature asking for it to be located there. We called it a substation so as to interest the people in the agricultural school and the experiment station, and to make them feel that it was a part of those institutions. They did not feel that way before but just the reverse. Afterwards the Government arranged to give us a man for the station, and allowed it to be under the care of the director of the experiment station at Brookings, and that is about all the connection there is between them. He directs the experiments and pays the expenses of maintenance of one man, and we have appropriated \$1,000 this year in the State. The greatest obstacle we ran against in trying to get that \$1,000 was that they said, "Here, you have \$30,000 or \$40,000

from the Government for experimental purposes; why can not you use that?" We could not make it clear that we could not use that money under the existing law, and for that reason they would not appropriate State funds to do the work they thought the National Government experiment station ought to do. We are doing a lot of work with the little money we have though, and we are going to do more of it if we have to get the money out of our own pockets. This thing must "go" or some of our stock and people must.

Q. The western portion of the State has conditions then that do not apply to the eastern portion?—A. More than three-fourths of our State can not be connected with the eastern part in the experiment work. It is impossible.

Q. Outside of the experiment work have you any suggestions to make that will assist in developing the western part of your State agriculturally?—A. That is another great big question, and I can not perhaps give you anything of much value upon it. I have one idea, however, in regard to irrigating experiments which might interest you. You know that much of our drier country there is underlaid with water. When we reach it with artesian wells it comes willingly to the top and with great force and in enormous quantities. We have, in some sections, by private companies and otherwise, put in lakes, dammed up large open basins, and put up dams and made basins, in which lakes are made from great wells. In some instances trees have been planted around the lakes and fish put in, and in this way most inviting and beautiful spots are made where scarcely less than deserts showed before. It is surprising how little a sheet of water of this kind costs, and how much it will add to the beauty and productiveness of a country. I have driven by these lakes during hot times when the southwest wind was blowing and scorching everything, and the moment I came near one of them on the northeast side—though a distance away—I could feel the difference in a much cooler and moister atmosphere. A flatiron shaped piece of green could be seen stretching away to the northeast from such places; that was one way it showed the effect of the water. I have thought if the Government could recognize this fact and use these artesian supplies of water with which to make great lakes and streams, bring them to the surface where the country needs them and where they belong, and distribute these lakes as frequently as practicable throughout western Nebraska, southwestern Dakota, and other places where these hot winds pass over hot, dry, burned-up prairies, in that way they possibly could give great benefit to the whole country and make it lovely, inhabitable, and healthful, where now at times it is little less than a desert.

Q. That would require Government help?—A. Yes; that would require Government help.

Q. Have you any suggestions to make as to how that assistance should come?—A. It seems to me I have seen a good many hundreds of thousands dollars thrown away to a great extent on our "river improvements," which, with less politics and more statemanship, might be diverted to this most practical use. This may be a difficult thing to do, however. It seems to be a kind of chronic disease with our Government to give that money out for some reason or other, to me inexplicable. I do not know why it is, and it is hard to discover what they do on our Missouri River, for instance, to offset so large amounts. Now, one-half the money that is put into the improvement of that river would give us a great many beautiful lakes, stocked with fish and surrounded with trees, where children and others could go now and then and think they were living. And I believe, too, that enough of them would materially affect the hot winds now so much dreaded. I believe, also, that if that fund could be so diverted, at least a portion of it, our people would rise up and call Congress blessed where now they sometimes do the other thing.

Q. Does your criticism apply especially to the Missouri River?—A. Yes; my observation would be along that line. Still it seems to us, knowing these possibilities and needs, that there are other large appropriations from which a little could be diverted to this much desired end, without materially affecting those who are supposed to be interested in this expenditure.

Q. (By Mr. A. L. HARRIS.) The suggestion is made whether an appropriation could be made in the shape of assistance in the propagation of fish in fish hatcheries.—A. Possibly; I believe to some extent that would be a proper channel.

Q. (By Mr. FARQUHAR.) The Government has already gone into a fish hatchery in Mississippi, and there is no reason why it should not up there in North and South Dakota.—A. I had not thought of it in that way. I know that when we put fish into our artificial lakes, we are surprised to see how they multiply and grow in a short time; but I am afraid such work could not be made sufficiently general. We would be very thankful for every little thing we got in that line, however.

Q. (By Mr. A. L. HARRIS.) Is the earning of capital employed in agriculture in your State satisfactory?—A. When you speak of it in small investments, I

believe it is paying as well as, or better, and is safer than anything I know of; but where it is put into large farms and they are farmed out, inexperienced men owning the capital in the land, I do not think it is.

Q. Does it compare well with capital invested in other industries?—A. From what I know of other capital and the returns it is bringing, I should say it pays a little better. Yet, in estimating that, our average farmers are determined not to reckon what they get excepting the clean cash for the crops they sell in town. They do not reckon what they retain for their own consumption, or the garden truck they raise on the farm and consume, and the cream, butter, eggs, meat, etc. When they reckon those, rent, and everything else, let alone pure air and true independence, it is away ahead. And for certainty of returns it so far surpasses those from the average business investment that there is no comparison.

Q. Would it not be a good idea to keep a cash account and debit and credit for the farm?—A. I think it would be a good thing, but I never do it. I keep run of enough to know I am away ahead of the average city man, though.

Q. The advantage of that would be that many farmers would then realize that they are getting ahead by remaining on the farm.—A. I think it would have that tendency. The only way to cure most of them who get city struck, though, is to have them leave the free farm life and home and live in the city at a fair salary and find themselves in debt every Saturday night and at the end of the year. A few years of this generally sends them back to the farm in a frame of mind to appreciate it, and the independence and worth of it. I have seen lots of them do that; it is being done every day. But the trouble is, too frequently there is no farm to go back to. When a farmer has for his family the best and freshest of all the land can produce, his meat, rent, livery, water, and sometimes fuel, in addition to eggs, butter, cream, milk, and fruit, he would be doing very well indeed, and much better than very many city people, were he not able to show any addition to his bank account, and this also any farmer who at all understands his business should be able to do. The certainty and permanency of his position should also be taken into the estimate.

Q. (By Mr. FARQUHAR.) You speak of the small farms. What information have you about bonanza farming?—A. Well, I should say it is a curse to the country, and to the man who tries it on, from what I have seen of it in North and South Dakota, particularly in North Dakota.

Q. What do you think is the particular evil?—A. In the first place, it keeps thousands of men from having little homes of their own, or will if they carry it too far, after the population gets more dense. Then, again, it employs men in squads, and this method eliminates all the individuality and independence of these men. It un-Americanizes them, and when you have done that to a man in this country you might as well have a wooden man, and you generally do have. Where you see the small farm there is generally a home, and not only is the farmer an independent typical American, as a rule, but the children have something in them that you can never get into them in any other way than for them to grow up on a piece of land. They have room and time to think out things there, to know how to make money, and what money costs. For that reason alone I think it is a bad thing all around to have very large farms.

Q. There is a good deal of changeableness in the hired help?—A. Yes; largely by unmarried men.

Q. How long are they usually on a bonanza farm?—A. Usually until they get paid the first time; but sometimes they will stay the whole season. Then, there is the mixing. Some splendid men come into this kind of employment, and they have to work with the worst kind of men. Then, again, they run out the bonanza farms, because they can not keep them up in any way yet known. They abuse the soil, get all the cream out of it, and then it goes to other people with small holdings for them to build up by careful rotation of crops, stock farming, and better tillage.

Q. Are these farms owned by resident holders or large bankers, etc.?—A. By men largely who spend their money in other cities or other States. The system robs the public schools, and detracts much from the social life of the country.

Q. The profits made on the farm are spent elsewhere?—A. Invariably, as long as they come; but they are sure not to come after a time. I do not know of one very large farm that has been running for some time that is paying to-day, and it is well it is so.

Q. Would you say that bonanza farming is on the increase?—A. On the decrease, in one way at least. But capitalists are seeing that the land is going to be valuable; that the population has caught up with it; that the population will increase and that land will not; and they are buying up small farms wherever they can get them; wherever the owner is so short sighted as to part with them. Wherever they can find a man that is hard up they make a loan and then some of them are

hard hearted enough to try to get the lands deliberately. They are putting on tenants. That is better than the bonanza farm, but it is bad enough. I wish there were some way this thing could be discouraged in this country. I do not know that the Government could take hold of it, but it is a bad thing and ought to be circumvented if there is any way to do it. In the richer portions of Minnesota, the Dakotas, and other States this is coming in in place of the bonanza farming, and coming in alarmingly fast.

Q. (By Mr. A. L. HARRIS.) Are the mortgages on your farms being paid off and released?—A. Yes; in many sections formerly heavily mortgaged the mortgage has nearly disappeared. Owing to pernicious political teaching in nearly every Western community a few can be found who are still looking to legislation, politics, and Presidents to get them out of debt, but this misguided class are fast waking up to the fact that politics and mortgage lifting do not run on the same range.

Q. Do you look upon the mortgage as being a curse, or is it sometimes a blessing?—A. Out West there is too great a tendency to run into debt, and I do not like to say anything that can encourage it. There seems to be something in the atmosphere out there favorable to it. A man, who in the East would not go in debt for 50 cents, after a year in Dakota would unhesitatingly run in debt that many thousand if he could get trusted for the amount. In a good many cases young men who are enterprising, and who have a few hundred dollars laid by, if they know their business, can take hold of a piece of land, put in a little money, and go in debt for the balance and make a home and pay for it; but that is the only case where I could encourage mortgaging.

Q. (By Mr. FARQUHAR.) Have you a regular rate of interest established by law in South Dakota?—A. Yes; 7 per cent.

Q. Is that the highest rate in the State?—A. No; they charge more than that, as a rule; 10 per cent almost invariably, and from that up to 15 and 20, according to how tight a place a man is in or how poor pay he is. That is not all one-sided, either. There is a tendency in our State not to pay debts on the part of a few transient people and some others. We have very heavy exemption laws, and while they are a grand, good thing in some instances and insure fair treatment, as a rule such large exemptions are working us ill. In fact, I sometimes think if the exemptions were much less it would be better for the country and people, and interest rates would be less.

Q. (By Mr. A. L. HARRIS.) Is your method of taxation satisfactory to the farmers?—A. Fairly so. There is a feeling among many of them, however, that they are unfairly taxed, but it is in many instances, and I might say in most instances, largely unfounded. There is this fact, however, that all the farmer has can be seen and will be seen, and for that reason he will pay nearer on what he has than the man who has his money invested in some other way. But if there is any intention that he should be oppressed or over taxed I do not know it.

Q. Is your property taxed at its full cash value?—A. No. The aim in my State seems to be to get about two-thirds the value, something in that neighborhood, possibly less.

Q. Does that basis equalize the farmer with the business man?—A. To some extent, yes. But, of course, where the funds are out of sight entirely we can not say how near it comes to it. Besides, most business men are taxed at about that rate, too.

Q. Outside of the fund that goes to defray the expenses of the State, is the balance expended in the county and townships?—A. Yes.

Q. Is the rate fixed by the local officer?—A. We have an equalization board that regulates these matters and equalizes the amounts after they are all brought in.

Q. After valuation?—A. Yes.

Q. Who fixes the rate of taxation?—A. That is fixed by the county board, and they are equalized by the State board.

Q. For your township, who fixes it?—A. The same authorities.

Q. For the entire county?—A. Yes.

Q. Does the school board have anything to do with fixing the rate of taxation for school purposes?—A. They are represented, but I do not think they have anything special to do with it.

Q. Is there any disposition on the part of your farmers to leave the farm and go to the city?—A. There is; but it is growing less, very fast.

Q. What has been the cause of that?—A. I think one reason is that many people rent farms that are not good land; or they take or buy a piece of land and think because they have done so that they are farmers, and they make failures of it and are discouraged. Then they have the idea that the farmer has to be a drudge; that he must get up early and work later than other people. A good

deal of that is disappearing with our better agriculture and better farming. Our farmers are adopting better machinery and more reasonable hours, and in that way we are getting over that once serious objection.

There was a time, and not long ago, when to be considered a good farmer one had to be up with the whole family at 4 a. m., and to keep himself and them on the jump till 10 p. m. was considered especially commendable. To-day just the reverse of this is becoming true in most of the best farming sections. The man who, after his land is paid for, finds it necessary to get his family out of bed at 3 or 4 o'clock in the morning in order to make a living is not an up-to-date farmer. He generally lacks in management or intelligence or both, or is of a miserly turn and is willing to sell wife and children and his own life for more acres and more money. There is absolutely no necessity for this kind of work or drudgery, and it is not looked upon any longer as indispensable to good farming. There has been reason enough for it, however. I myself have seen more than one worn-out farmer's wife, above whose grave a very appropriate inscription would be: "Stopped doing chores" such and such a time. Many boys and girls are worked so hard on land that forever afterwards the thought of farming is distasteful to them. But this is all wrong, and the advanced agriculture of to-day warrants as much leisure, as tidy, up-to-date homes and living as any other profession. Rural mail delivery, telephones, and better roads and teachings have all much to do with this.

Q. Is there any increase in the price of agricultural products compared with 1 or 2 or 3 years ago?—A. Yes; it is principally in beef, mutton, and such things. Our meat market used to go up and down frequently and violently, but there seems to be a steadier demand and the prices tend upward. I attribute that change to the advance in the value of land. We find that where land is high meat is high all the world over, for it takes land to grow meat. No matter how fine a desk one may have in his office, or how fine a counter in his store, he can not grow mutton, pork, or beef on them.

Q. Do you raise sheep exclusively for mutton?—A. We take what wool we can get, but we raise sheep nowadays for mutton.

Q. You raise a mutton sheep instead of a wool sheep?—A. Yes; we raise but very few wool sheep in our country now.

Q. (By Mr. CLARKE.) What breeds do you have mostly?—A. As a rule we have some of the dark-faced mutton breeds crossed with the average Western sheep. We are working largely toward the dark-faced mutton sheep on farms and for finer wools on the ranges.

Q. Are they of coarse or fine wool?—A. Mostly coarse wool.

Q. How many pounds of wool do you generally shear?—A. I would judge about 7 pounds. We have flocks that do very much better and some that do not do so well.

Q. Is the wool a considerable item in the profit of the sheep?—A. Yes; it is a good big item. Still, with the right kind of sheep and the right kind of care and management we can make a pound of mutton as cheaply as a pound of beef and not take the wool into consideration.

Q. Could you safely dispense with the protection on wool and still find the sheep industry profitable?—A. Where we live, with cheap lands, I think we could; but I would not want to say for the whole country or the whole of South Dakota. Our lands are cheap, and we have some advantages. I think we could still make sheep profitable without the tariff.

Q. (By Mr. FARQUHAR.) You would answer thus provided the present prices of wool were maintained?—A. That would open the whole question. Yes; I would say if the prices were maintained close to the present price. At the same time, we can raise mutton on those cheap lands with very little wool and make it profitable.

Q. (By Mr. A. L. HARRIS.) Have you any protection from dogs in raising sheep?—A. Not very much.

Q. Do they destroy or demoralize your flocks?—A. They have done so to a considerable extent. I have had but little trouble with them during the 21 years I have kept sheep, but they are a curse to the industry, and in some sections they have succeeded in driving the industry out.

Q. Have you dog laws?—A. Some. They change them nearly every 2 years, but they do not work well.

Q. Do they not create a fund sufficient to pay for the loss?—A. No; and then it is so complicated and difficult to adjust the claims that it is almost a dead letter.

Q. (By Mr. CLARKE.) Is there any economic necessity for keeping dogs in your State, and are they of any particular value to the people?—A. No; they are not; none on earth; as a rule they are a great tax upon our people and an unmitigated curse.

Q. (By Mr. A. L. HARRIS.) Is there any increase in the money value of your farm land?—A. It is increasing very rapidly at the present time and has been for the last year and a half or two years; coming up fast—alarmingly so in some sections of Minnesota and the eastern part of the Dakotas—that is, alarmingly so for the young men who have left the land recently with the thought of buying it again some time when they feel like it.

Q. To what do you attribute that increase in value?—A. Principally to the fact that our population has caught up with the land, and the old country conditions are right at our doors; the population keeps increasing while the land does not, and never will.

Q. Does the general prosperity of the country have anything to do with the increase in value?—A. I think money being easy has been a material factor in it. If men have money, they can not make a mistake in buying good lands in competition with those who want to make homes. Those two factors are the cause of most of the advance, in my judgment.

Q. Are your farmers maintaining the productive condition of their soil?—A. A few of them are; too many are not. The very large farms are simply running out.

Q. How do they maintain their fertility?—A. With stock largely; rotating crops and keeping a good lot of stock on the farm. We can not raise clovers to any great advantage in the Dakotas. In Minnesota the clover plant ranks side by side with the stock in keeping up fertility. The rotation of clover with other crops and stock keeps the land up in fine shape.

Q. Is diversification an important factor in your farming?—A. Yes; it is an important factor. Still, in everything else business is tending to specialize, even in the professions; and I do not see why farming should be an exception. I find, too, as a rule, that the farmers who are making a specialty of some line of farming, and then bringing the others in incidentally; studying their own tastes, location, market, soil, etc., and then getting at something to which they are particularly adapted, and mastering that line of farming, either in stock or other things, are getting ahead. They have more time to live, and their sons are more apt to go into the farming business. Specializing eliminates to a great extent the one crying objection which so many young men and women seem to have to farming—the confining, choring part. For years I have made a specialty of sheep and poultry, and consequently the choring part of the work on my farm has been greatly simplified. I think that the best part of our advanced agriculture is the tendency to specialize. I judge by what I see of the best farmers in Minnesota, North Dakota, and my own State. Still it is dangerous to advocate this kind of farming too much with the inexperienced.

Q. Do you find it difficult to maintain the fertility of your soil by special farming?—A. Not when it is in the stock line; but when it comes to raising wheat exclusively, or anything of that kind, we do not consider that farming. Farming means stock on the farm, every time.

Q. Have you turned your attention toward raising stock instead of raising wheat?—A. We have been compelled to—not from preference.

Q. Why was that?—A. Because wheat growing exhausted the land and exhausted the pocketbook. It figured well, but did not turn out so; did not bring the money. Wheat is also more subject to harm from climatic changes. With stock there is sometimes a little less income, but it comes all the time, in spite of dry seasons or hail storms, and the soil is improving instead of going down. That is the principal reason.

Q. Does your country confine itself to the raising of sheep alone?—A. Oh, no; in my case I have cheap rough land. Sheep are adapted to rough hill lands, and so I have made a specialty of them and of poultry. I had to buy cheap lands because I did not have money to buy expensive lands. Besides, I like sheep and poultry. What I get from them is nearly all profit. There is little hired help required in growing them, and it takes no large investment for starting, putting up buildings, or getting machinery. The income, too, is constant, and sheep and poultry do not ruin our land.

Q. Is it advisable for farmers to organize?—A. I probably should not say anything for I do not believe in such organization, as a rule. I do not believe in anything of that kind, and never shall. There are a number of reasons for this position, and the principal one is that organizations tend to eliminate the individuality of the man; they tend to make him lean on somebody else, and he does not develop his own muscle. Besides, these organizations, in my State, have been drawn into politics. The farmer has to work, and can not think as sharply as the politician. The politician has nothing but politics to think about. His harvest is votes, and he will work these organizations in spite of everything. They organize and swear they will have no politics in the organization, but before you know it they have it all through. The farmer who is trained to stand on his own feet, on

his own land, is worth a dozen who have to huddle together in order to stand up at all. There is a growing tendency, too, I am glad to note, among our best farmers to look more to themselves and less to organizations, societies, politics, legislation, etc., for their success. This development of individual resources, this relying upon one's own ability to compel results, begets a manly self-confidence which, when accompanied with good common sense and a fair knowledge of the affairs of the world, makes one's efforts in a chosen line almost irresistible. Just the reverse is the effect of forever leaning upon others and upon each other. The carefully protected and provided for boy never develops into the strong, self-reliant, success-compelling manhood of the father who knew no protection other than his own; no provision he did not provide; no achievement not wrought out by his own tried and willing hands. All this applies strongly to the farmer and farm boys. Our best ones are almost invariably the ones who lean upon themselves.

Q. Have you any social clubs, such as farmers' clubs, or stock associations, or anything of that kind?—A. Yes; we have a few of them. There are a few small clubs in some localities, and they try to make them interesting for the young people, but there is nothing very extensive in that line. Our young people generally manage to have a pretty good time when they get together without being told how. Clubs and associations in the country are apt to have too many rules and regulations about them—too much harness and too little horse. Their success depends much upon the individuals composing them.

Q. You spoke a moment ago of raising wheat being hard on the pocketbook. Did you mean by that expression that there had been an overproduction and low price, or do you mean that your soil does not produce a sufficient yield of wheat to be profitable?—A. Both. We can not make it pay to raise wheat year after year. We lose crops by hail or drought, and if we have a failure from any cause and have no stock our year's income is gone, and we can not risk it on that account. Then again, it exhausts the soil constantly, and we can not afford that. It is not a paying business only as it is brought in incidentally in rotation with stock farming.

Q. How long has it been since you turned your attention to raising stock?—A. I have never raised grain to amount to anything only to feed; but the attention of the whole Northwest is turning to stock more within the last few years.

Q. Will that change decrease the wheat production?—A. It will, a little, for a time; but I know of farmers to-day who are raising more grain than before they put the stock on the farm, because their farms are cleaner and richer. The coming of stock does not mean the going of grain from the farms of the Northwest. With good stock farming it will continue to be as now "the granary of the world."

Q. Has improved agricultural machinery been of benefit to the Dakota farmer?—A. Well, yes. But it has ruined many a man to buy machinery when he could not pay for it though, and perhaps did not need it. As a rule, however, it has been a benefit. If you carry it clear through it perhaps has not been a benefit to the grain grower, because the invention and use of improved machinery has, with the opening up of so much easily tilled prairie land, tended to reduce the price of grain; and in that way it has been harmful, perhaps; but still they have raised more of it with much less labor. When I first worked out it took 5 binders to follow a machine, 1 man to rake off, and 1 to carry the bundles together. Now the hired girl frequently drives a machine that does the whole business.

Q. With the low price, would it have been possible to raise grain with any profit without the use of machinery?—A. No; nor would we have had the low price without it.

Q. Has there been any increase in your transportation rates in the last 2 or 3 years?—A. No; they have steadily decreased. They have sometimes fluctuated a little, but the tendency has been to decrease. We also gain very much in time on stock shipments. We get our stock into the Eastern markets with half the shrinkage we formerly did, and with lower rates. The railroads are using our stockmen very well.

Q. What is the condition of your roads and highways?—A. In South and North Dakota they are excellent, and will be, regardless of work on them, because we have dry climate and a soil that makes good roadbeds. In Minnesota the roads are in some parts so poor that they really detract from the value of the land along them.

Q. Is there any disposition in Minnesota to improve the roads?—A. There is; but they do not get at it with any intelligent understanding of the business. There they leave every district to some one man's ideas, and sometimes they are very crude. They spend enough money on the roads, but they need some instruction on road building. There should be a more intelligent and general supervision in some way.

Q. What do you know about combinations to control the prices of grain in your State or North Dakota or Minnesota? In other words, is there any elevator combine or monopoly that you know of?—A. Yes; it exists all over our State—all over the three States. In some way they have it arranged so that, while I believe, as a rule, prices are governed by supply and demand, at the same time the "line" elevators receive their prices every morning from headquarters, and they are the prices that govern.

Q. You speak of the line elevator. Is that any special kind of elevator?—A. I refer to the kind where one company owns a long line of them. These companies seem to have an understanding with each other, and frequently one man gives the prices for several lines of elevators.

Q. Have you more than one elevator in the same place owned by different companies?—A. We occasionally have two. They seldom multiply much; but sometimes by accident or otherwise there are two representing different lines of elevators.

Q. You may explain, if you please, how these elevators are detrimental to the producer of grain?—A. Principally in the fact that they regulate prices regardless of the demand, and can put them up and down in a way to give themselves an illegitimate margin. Again, when we put in farmers' elevators, as we sometimes do, they sometimes use their power to crush them. They put up the price until that elevator can not do business, and when it quits they make it up with interest. Then, again, if the railroads would keep their hands off, if they would not hold us while these elevators rob us, we would be all right. I do not complain much about the railroads; they have used us very fairly in most ways, much more so than many farmers will admit, but it is a fact that when these elevators undertake to hold up a community they sometimes lend a hand. If they would keep their hands off we would be able to attend to these fellows all right. We could put up our own elevators and do business till they would howl as long and loud as any farmer ever dared to, and howling wouldn't help them, for our buyer's salary would be all the profit demanded. It might take us a little time to find out just how to buy wheat and to do this, but we could do it. But when they come in and will not let us build these elevators, of course we are handicapped. One of the worst things in the Northwest to-day is the tendency on the part of many farmers to believe that they are being imposed upon by everybody and everything. This has a most pernicious effect, and it is largely imaginary, but not without some basis. For instance, in Gary, my own town, we have 2 line elevators. A little while ago we wanted to put in a people's elevator, and another man wished to put in one himself, an independent elevator. Our people held a meeting, called the railroad commissioners there to help us, and the railroad people were notified and came there. They had attorneys and examined witnesses, and finally decided that we could not have the room for the elevator. That they gave us a hearing is true, but the decision was adverse. We know these line elevators are not competing with other farm elevators in prices. There will be lax seasons when they pay the same, but when the wheat is really coming in they do not, and thousands of bushels are diverted to those places where they have the other elevators.

Q. What is the difference in price between places where there is competition and where there is no competition with the line elevator?—A. I can not say only from observation. I should think there are places where we have traced it, where there is a half cent to a cent and a half per bushel, and sometimes a much larger margin—enough to rob the farmer of all the margin of profit he had in some cases. In the case I have mentioned, they heard our case and decided that we should not have the room for an independent elevator. I asked them why it was. They said they had investigated and proved that the amount of grain was not sufficient to demand 3 elevators; that 2 could handle it all right, and they did handle all they got all right, but we could have had a great many more bushels if we had had a farmers' or an independent elevator there, and there would have been better prices.

Q. Did the farmers haul the wheat away from that territory?—A. Yes; I have known of several instances and heard of many more.

Q. Do you know of any other place where the railroad has donated the ground to build the independent elevator upon?—A. I do not know that I could name any. I know of a number of cases where they have had great times over this very thing.

Q. Is that complaint pretty general over the State?—A. It is fairly so, but not so much as it used to be. They have done better with us than they used to do, and seem more and more inclined to be fair with us. Our railroad commissioners have been after them, and they seem to have broader and more liberal men in charge of our local affairs than formerly.

Q. Have you a railroad and warehouse commission in your State?—A. We have a railroad commission.

Q. Do they have charge of the elevators?—A. To a certain extent. They came to our hearing. As the railroads had to donate the place to put the building on, they also came, and they heard it through. But the people have not much confidence in the railroad commissioners. They are about as distrustful of them as of the railroads. They are perhaps too much so.

Q. Are they elected or appointed?—A. Our commissioners are elected by the people. They are put up just as the other officers are and voted on.

Q. Is that method satisfactory?—A. It ought to be. I can not say but our commissioners do well by us as a rule, but in this case we felt there was no reason why they should say whether we should or should not have a piece of land for the elevator. If in our judgment we wanted one and had men there to build one, we felt they should not say us nay. It was exercising a power that they should not have over a free people in such a matter. If we are foolish enough to build too many elevators I can not see why the railroads should insist upon enlightening us. They get all the grain to haul anyway.

Q. The railroad owned the ground?—A. Yes.

Q. Who inspects your grain?—A. I do not know much about that. It is sent out and goes into the regular channels. I am not acquainted with that part of the business.

Q. Who fixes the price of the grain in the line elevator?—A. I do not know. I know that Mr. Vandusen used to send out the price lists. His name was attached to them. They come to our local railroad agent and he hands a copy to each of the line elevator representatives from the same telegram.

Q. Where does he live?—A. He is at St. Paul, I believe, but his headquarters are at Minneapolis. I used to see the prices he would send out.

Q. Was that price fixed by the market value over the country?—A. I do not think it was, but I could not prove that to you; you can judge for yourselves whether it was or not. I have understood they have a board of the representatives of the different line elevators that meet and decide what they will do. Of course it is possible they meet to push the price up just as high as the market will warrant, but if this is the case we have reason to believe the object of their meeting is sometimes lost sight of.

Q. Do these line elevators belonging to different companies work in harmony?—A. We have never seen anything to make us believe they did not.

Q. Do they work in harmony with the independent elevators?—A. They never do.

Q. Are the line elevators managed by residents of the place where they are located?—A. They frequently hire a man to run the elevator from the particular community, but the managers are generally men who have been in their business. Of course, they have to be loyal to their employers.

Q. Do I understand there is no competition whatever between any two line elevators?—A. It sometimes shows up in a mild form.

Q. Do you know whether or not they pool their receipts?—A. We understand they do, but I do not know.

Q. Were they at any time inspected or audited by the same man?—A. I could not say as to that either.

Q. Have you anything further that you desire to say in regard to the elevator question?—A. No; only I wish we might be at perfect liberty to build and buy and ship as we wish to, that is all. The intelligent Western landowner asks no odds in his race with capital, only that he be not handicapped. In an open field he needs no odds in his favor, and the fewer he asks or receives the more successful in the long run will he be, and the grander man and citizen will he become.

Q. Is this complaint against the elevators pretty general throughout the State?—A. The feeling that way is pretty general.

Q. To what place do you ship your grain?—A. It goes largely to St. Paul and Minneapolis.

Q. Have you a pure-food law in your State?—A. Yes.

Q. Have you any suggestions to make as to the advisability of a Federal pure-food law?—A. I am hoping that our Government will take hold of that subject to the extent, at least, of having our drugs and the foods that we eat left alone. Again, it comes clear down to our stock foods, which are, in some instances, it seems to me, the greatest hoax on earth. But it is difficult to handle the question, and our agricultural papers seem to be afraid to take hold of it and say what they think, possibly, in some cases, because the proprietors of these foods advertise extensively. It puts the farmer in a bad place. He ought to know better, but he does not; and there are millions of dollars' worth of stock foods sold that do not amount to anything. Our experiment stations ought to take that question up and publish the facts widely. Again, many of our farm papers do not know and have no

way of knowing how little good there is in some of these foods; some are doubtless good.

Q. Would it not be well to have a law requiring the experiment station to look the matter up and test the quality of the foods?—A. If it could be done I think it would be a good thing if the Government was behind it, but the local laws do not seem to amount to much. The violators of the laws do not seem to fear them. A few far eastern stations are giving this matter attention.

Q. Have you anything to say in regard to the operations of the Federal law or your State law for protecting domestic animals from disease?—A. I am not conversant with any part of it other than that relating to scab in connection with sheep, and that is a very serious thing, a serious loss to the nation. We looked it up very carefully as an association while I was president. I studied it carefully, and from what I could learn in no country where they have local laws, as our State laws in this country, have they ever amounted to anything in driving scab out. England failed in Australia and other provinces until she took hold of it herself and made it a high crime. Now it has been driven out of Australia entirely, at least so from large provinces. In our country we have no general law of that kind. It is a great big loss. We have such large flocks of sheep and so many millions of them west of the Mississippi River that we can not do anything with scab with State laws. Dr. Salmon has done a great deal of good along that line. He has been made all kinds of sport of by some stock journals because he did not do it as they thought it ought to be done, but as a practical sheep man I must say, though he has made mistakes, he has done us a great deal of good. But he ought to be helped by some general law and not be left at the mercy of fault-finders and State laws. Maybe it is something the Government can not do. Maybe the States will insist on meddling with it, as they do with some other things, but it is the only hope I have. Our State laws on such questions do not amount to anything, and I hope the Government will take hold of it.

Q. I understand you advocate giving the Federal Government more power?—A. Yes; absolute power over that kind of thing; also food and drug adulterations, and over all combinations of capital for the regulation of prices of products and transportation. Such control would do much to eliminate the feeling from the farming classes that they are abused; that every man's hand is against them. It would help them to realize that their business is a business; that it is a profession—one to be mastered, one to be thoroughly understood, and one to be proud of, sure in its returns when understood, and sure to be a failure when it is not understood. I think it would go a great ways also in getting rid of this feeling that they must be sustained from the outside by favorable legislation, politics, etc.

Q. Do farmers, as a rule, look very much to tariff for relief?—A. Many of them do, but I do not know as it would be legitimate to enter upon the tariff question here. I am a Republican, and I believe in a moderate tariff, but as a practical sheep man, 21 years in the business, I think if the word tariff had never been in existence our sheep industry would be better off. At the same time many of our people believe that it is necessary to have a tariff put on wool before sheep will pay, and will come to me and offer \$4, \$5, or \$6 for sheep with a tariff on that they would not pay \$2 for if there were no tariff. There is so much feeling of this kind that they slaughter the flocks off every time the tariff is reduced and ruin the market for mutton, and then rush back into the business when a little tariff goes on, till they overdo it. In this way indirectly the tariff has been the cause of harm to us.

Q. Your complaint is in the change of the tariff and not in the tariff itself?—A. Yes. If we could have a moderate tariff and have it permanent it would help the sheep man, but fluctuating it is a detriment to him.

Q. (By Mr. CLARKE.) How can you say they overdo it when the production of wool in this country is still very far short of the domestic demand for wool?—A. We have to get rid of the body of the sheep as well as the wool. If we could double up the amount of wool on each sheep, we could still get around that all right; but we get only about 7 pounds of wool to 100 pounds of mutton, and when we overdo it the 100 pounds of mutton feels it, and when that fails us the 7 pounds of wool will not save us whatever its price.

Q. Is not the market for mutton increasing?—A. Yes; we are getting better prices on the average, but every time the tariff goes off a little bit so many sheep are rushed on the market that mutton men are almost ruined.

Q. Is not the moral of that situation to keep the tariff on, so the sheep will not be slaughtered?—A. Yes; if you will keep it on moderately and not get it so high a majority of the people won't let us keep it on—and then give us a dose of free trade. A moderate tariff seems to me the only safe tariff.

Q. Do you know about the decline of flocks during the free-wool tariff?—A. Oh, yes; our flocks went down enormously and our profits with them. We made

hardly anything during that time, for two reasons. If people who had sheep had not rushed them on the market and dumped the market, we would have been all right. When wool went down we could stand that, but when the mutton market went down, too, and we could sell neither mutton nor wool we had to suffer unnecessarily. Rushing sheep into the market was what ruined it.

Q. Since the enactment of the Dingley tariff there has been some increase in the flocks has there not?—A. Yes; a material increase.

Q. And a fair price for both mutton and wool?—A. A fair price for both up to now. Wool is pretty heavy now to get rid of. It is fully 5 cents lower than a year ago with no change in the tariff.

Q. Do you know what makes it heavy now?—A. I think the holders depend too much on the tariff, and enormous quantities of wool were bought at a higher figure than the situation would warrant. They got this in expectation of getting big figures, but they could not hold it. They are now throwing it on the market and it is depressing prices. Then we have increased our flocks some, and wool is lower all over the world.

Q. Do you know what the importations of wool were during the last fiscal year?—A. No, I do not; but they were a good deal less than formerly.

Q. Do you know whether or not the conditions of which you speak in Dakota have arisen among the wool men throughout the Mississippi or trans-Mississippi region?—A. To some extent; but we can raise sheep so much more cheaply than you can in some places that I do not know that it would be a fair comparison for the whole country.

Q. I understand you to say you were raised in New England?—A. Yes.

Q. What part?—A. I was raised in Kennebec County, Me., but did not grow up there, and I know nothing about their agriculture or stock raising other than from what I have read.

Q. You do not feel competent to speak concerning conditions of sheep husbandry in New England?—A. Not to any extent. I am aware of some things transpiring there, but not from personal observation. I know they are restocking some of the worn-out lands with sheep, and with success.

Q. Is there much cattle raising in your part of South Dakota?—A. Yes; cattle are increasing rather faster than sheep.

Q. Is that industry profitable?—A. It is profitable; more so than anything else, unless it be sheep.

Q. Do you think the farmers realize anything from the duty on hides?—A. I think it helps them materially just now.

Q. They would be loath to have it repealed, then?—A. I think they would, and there is not a sheep man in my State but prefers to have the tariff on wool. It is the uncertainty of the thing that hurts his business so.

Q. They think they get a better price on wool for the tariff?—A. They think so.

Q. Do you think so?—A. I think we have had more money for the wool than we would have had without the tariff, but I am looking for the reaction which has always followed so certainly. I think the agitation of the matter does us harm in the end, or in the long run rather. This same reaction comes to over-encourage mill and factory building.

Q. Do you think there is danger of a reaction unless the tariff is reduced?—A. No material one. There is going to be a little reaction, however, from overprices paid by speculators largely. They bought too much wool at too big a price, and held it, and are now shoving it on the market. Wool has fallen 4 to 5 cents a pound since a year ago, and in my judgment will go lower.

Q. The testimony of wool experts given to this commission is to the effect that at the present rate of increase in the flocks it will still be more than 20 years before we shall grow the wool that we consume.—A. I believe it.

Q. That being the case, would it not seem to you that if the tariff question remained about as it is there would be a good steady price for wool?—A. Yes; there will not be any big prices. We will have to take lower prices than we have taken for the last 8 years, but if we could be assured of a steady tariff, we would not ask for anything better in the sheep business. It is the uncertainties which I refer to as the great drawback to us, and which, it seems to me, nearly or quite offset all the advantages a tariff can bring us.

Q. (By Mr. FARQUHAR.) What was the condition of the sheep business 7 or 8 years ago, when the tariff was changed, in Kansas and southern Nebraska and Colorado? Can you recollect?—A. Just before we had it put on again it was thoroughly demoralized.

Q. Do you know anything about the prices paid in Kansas City then for sheep?—A. No; not in the market. I know something about what we got for ours shipped to Chicago. It was this rush and slump I referred to before as being the outgrowth of a fluctuating tariff.

Q. Do you think a return of better times and the increase in your sheep raising is equal to the normal increase that there would have been if there had been no change in the first wool tariff?—A. No; I think the tariff has helped the sheep man some.

Q. Is it only the refrigerator car in transportation that gives you the advantage of marketing your mutton at wider points than you did 10 years ago?—A. No.

Q. Is there any means of curing or keeping mutton so that it will carry farther and reach a market fresher than 10 or 12 years ago?—A. Oh, yes.

Q. Will you describe to the commission that feature of it, the advantage that mutton now has of reaching a farther market than a few years ago?—A. In the first place we have more rapid transit. Twelve years ago we could not get a sheep to Chicago as we can now. It took one-third more time than to-day from where I live. We have better facilities, better cars, better facilities across the ocean; and we are raising better sheep. We get them ready for the block now and they are taken, many of them, for export. Many sheep go from St. Paul for export where formerly we did not sell one. The refrigerator business that you spoke of is confined more to South American and Venezuelan and Australian flocks. It has seemed to us that if these refrigerator cars had not been invented our American mutton would get across any way and we could get better prices than we do now.

Q. Ten or 12 years ago you had nothing more than a local demand?—A. No.

Q. Now you have a world demand?—A. Yes.

Q. Is there not an increased public taste for mutton?—A. We feel that is one of the good results of free wool. Sheep were sold, in the blind rush out of sheep, so cheaply that everybody ate mutton. The public then acquired a taste for mutton and they can not get over it. It is about the only way free wool did help us.

Q. (By Mr. A. L. HARRIS.) There is one further question I would ask. What remedy have you to suggest for this elevator combine that you speak of?—A. If I could, I would make it a crime to do that kind of business and make the punishment so quick and so severe that it would not be done a second time.

Q. A law of the State or of Congress?—A. Congress every time. As to State legislatures, I have been a member of them two or three times, and I have not a very high regard for what they can do.

Q. (By Mr. A. L. HARRIS.) Under what authority would you invoke the aid of Congress under the Constitution?—A. It is possible that we can not; but it seems as though we ought to be able to do it. If in any way you can get them to take their hands off and let us build our own elevators they can go on combining. If we could build our own elevators and run them, and have an equal show in shipping, I think we could regulate this combine business.

Q. Will the railroads give you equal facilities with the line elevators?—A. We try to think they would. Shippers can give you more information on this than I can. They have always used me "fair and square."

Q. Could not your State railroad and warehouse commission be made effective if there was properly executed a good law?—A. I think they might possibly.

Q. Could your railroad commission do more than it is doing in giving you relief?—A. Possibly, and I think they have tried hard in a good many instances; but for some reason there is so much change in the laws, so many crooks and turns, so many deferred trials that we do not get very quick action or very good results.

Q. Is this complaint you speak of confined to your State?—A. Oh, no; that is the feeling all over—wherever they have control.

Q. Do you find that condition in Minnesota?—A. Yes; excepting where they have grist mills, or local buyers, or other means with which to handle their own business. Wherever those conditions exist they do not feel it and do not say much about it.

Q. Is there anything you have not touched upon?—A. I do not suppose it is possible to help us any in the line of enlarging the field of our experiment stations, making the distribution of the funds more elastic, or anything of that description?

Q. (By Mr. CLARKE.) Now, that that subject is up, I would like to say that I do not quite understand the way the Secretary of Agriculture apportioned that fund for experiment stations. Is it done according to the needs of the State?—A. It does not seem to be; but I do not quite understand myself what influences him. My impression was, from what he said, that the laws regulating such matters are so that he could not do differently; still, he said, that it would open up such a wide demand, should he change the ruling in such things, that he had to hold back on that account. I take it that a ruling has long applied to these funds, which confines them to the single station.

Q. If the law is in the way we could recommend Congress to change the law?—A. Yes; I thought of that, of course, in connection with my suggestion; but I am

not positive of this—I am under the impression only that in some way the Secretary is bound in the matter.

Q. Now, if there are any points or things which occur to you, not yet touched upon, affecting the general welfare and agriculture of the Northwest, with which you are personally acquainted, will you kindly go over them in your own way.

In response to this invitation the witness made the following written statement:

DECLINE IN VALUE OF LANDS EAST.

First, our Western prairies were free from stones and stumps. For this reason, and because of business openings, the people got into the habit of coming west, and they can't stop. Again, all go west for less inducements than they will go east. This seems to be an instinct. The hop vine will not go around the pole from west to east, and can't be made to. Neither will men. The only race that ever tried it on a large scale is the Chinaman, and Uncle Sam stepped in and helped nature out. If the Chinaman had come from the east through Boston and New York, no one would have stopped him. Careless farming made many Eastern farms poor, and the young men preferred to go onto rich lands rather than making poor ones rich. But land will go higher east soon, and stay high.

RURAL DELIVERY.

Rural delivery is going to prove one of the greatest blessings and educators ever brought to the back-country farmer. Its value can not be overestimated. It not only helps to make more contented those already on the lands, but it enables a most excellent class from our towns and cities to make permanent homes in the country who would never think of doing so without regular mail. As an educator, and as an inducement to make landed homes, the Government could well afford all its costs.

POSTAL SAVINGS.

Next to rural delivery, for downright cost value to the common people nothing surpasses the possibilities of postal savings banks. This means much more than the well-to-do can ever know. I have seen many a man working with me in lumber and other camps, on railroads and on large farms, who could not be induced to save or lay up a dollar, because they knew of no safe way of keeping it in small amounts. I have urged not a few young men who were spending every cent they earned in "good times" to lay by a little of it, who promptly showed me accounts with "busted" banks, and swore they would not try again, and kept their word. Nothing could help the common wage-earner more than well-established postal savings banks. I believe this from what I have seen of it.

FIGHT FOR THE FORESTS.

In traveling extensively over the timber sections of the Northwest, particularly northern Wisconsin and Minnesota, as surveyor, lumberman, and riverman, and later institute worker in the newer sections, I have been deeply impressed with the importance of doing something to preserve the young second-growth evergreens, and as much as possible of the evergreen forests now standing. Only a few years ago there were whole counties of pine and hemlock at the head waters of the Mississippi and its tributaries. Under these dark, dense evergreens were deep mosses from 6 inches to a foot deep. I have seen snow and ice in this moss in densely shaded places as late as the middle of June. The snows melt slowly here, and it took months for them to ooze through the moss and deep-surface loams. Millions did not have to be spent there to ward off floods far down the streams. Nor did the streams nearly dry up as they do now. Vast regions thus protected have been stripped of the pine and hemlock, and then these slashings burned over, moss and surface soil often going too, till now one hot March day sends a winter's snow rushing into overflowing streams.

By all means great parks of these evergreens, particularly at the heads of great rivers and on poor nonagricultural lands, should be preserved. Thousands spent this way by Congress will save millions later building dikes to save the country along the Lower Mississippi and then they can't save it. Besides this stripping of the great evergreen forests is showing desert conditions farther east from the mountains every year. On the banks of every lake and stream are proofs of this. The greatest, most blessed thing Congress can do for the nation to-day is to quickly set aside immense parks at the heads of all our great streams to once more hold the snow. It is a dangerous thing to throw nature out of balance.

OLEO.

In my judgment, no very severe oleomargarine law can ever be enforced. It should be made however to sail under its own colors just as drugs and other foods should. We doubt if more stringent laws can ever be kept on the statutes. Many prefer oleo properly made, as it is it possible to have it much cleaner than butter, the milk for which has been drawn and cared for by every kind of a milker, from the cleanliest to a Comanche or a Zulu. It is hard to get clean milk in mixed countries.

(Testimony closed.)

WASHINGTON, D. C., June 11, 1901.

TESTIMONY OF MR. A. H. NAFTZGER,

President and General Manager Southern California Fruit Exchange.

The commission met at 11.02 a. m., Mr. Phillips presiding. At that time Mr. A. H. Naftzger was introduced as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. A. L. HARRIS.) You may state your full name, post-office address, and your occupation.—A. A. H. Naftzger, Los Angeles, Cal. I am president and general manager of the Southern California Fruit Exchange.

Q. How long have you occupied that position?—A. About 5 years.

Q. How long have you been a resident of the State of California?—A. Sixteen years.

Q. What field does the fruit exchange cover?—A. The Southern California Fruit Exchange is a cooperative organization of fruit growers, engaged in marketing the products of the orchards owned and controlled by its members. It handles or markets only oranges and lemons. I might say citrus fruits, to make the statement more accurate, because it includes grape fruit; but our business is particularly confined to oranges and lemons.

Q. You might outline a little further your mode of operating.—A. The organization is a voluntary association of citrus fruit growers solely for the purpose of marketing their products. It has nothing to do with growing, but confines itself to the purchase of necessary supplies for packing and to the business of shipping and selling. The business is wholly under the control of the growers themselves, and the fruit is marketed for all members alike on a level basis of cost, no profits arising to anybody connected with the organization except salaries to its employees, and the better prices to be obtained for the growers.

Q. You say it is a voluntary association. Do you mean by that it has not been incorporated?—A. It is incorporated; but the Southern California Fruit Exchange itself is a very limited corporation. It consists in fact of 11 members, all of whom are directors. These 11 directors are selected by what we term district exchanges, and having been nominated by these district exchanges, they are elected members of the board of directors, and that organization is purely a marketing agency for these local or district exchanges. In the various sections that grow citrus fruits extensively, we have organizations usually incorporated with a nominal capital stock. In some instances they are incorporated under the cooperative law, but in most instances are regular statutory corporations. When I say the organization is voluntary, I mean that it is so organized that any member may withdraw. If he is a stockholder of course he can sell his stock, or, even without selling his stock, he may withdraw his fruit at some time during any year, usually at the close of the marketing season. He is bound in a contract to the organization to leave his fruit of any one season under the control of the organization to be marketed entirely under the direction and at the instance of the organization itself. In other words, he puts his fruit for the time being or for the season beyond his control.

Q. (By Mr. LITCHMAN.) The object of that?—A. The object primarily was to avoid the disasters of the commission system. Prior to the organization of the exchange, fruit was to a limited extent sold f. o. b. California, either at the packing house or at the orchards; but in a very large number of cases was consigned to commission houses in various cities of the country to be sold on commission for account of the shipper. This proved disastrous to California citrus fruit growers, because of our very long distances from markets and the consequent contingencies that intervene in the way of decay and the impossibility of know-

ing much of anything that was going on in the markets, etc. The organization was perfected for the purpose of taking out of the hands of the middlemen the marketing of the product, and to establish an independent system to take the place of the middlemen, under the absolute control of the growers themselves. This was done chiefly through the establishment of our own selling agencies in the chief markets of the country, where we sell our goods direct to the jobbing or wholesale trade.

Q. (By Mr. A. L. HARRIS.) Have you been able, since your organization, to avoid overproduction or gluts of certain markets?—A. Only to a limited extent. In proportion, of course, as we are able to control the product at that end of the line, we are able to regulate its distribution in the markets. But our association began with about 25 per cent of the crop and we now have 50 per cent. Of course, while there is 50 per cent beyond our control, we are not able absolutely or even approximately to control the distribution, although we are able very largely to regulate it. Being ourselves the heaviest shippers and being able to put a liberal supply at any time into any market, we can exercise a very powerful influence over the conditions in that market; and in proportion as we are getting a larger control of the product we are able more largely to control the fruit distribution.

Q. Do you approach in any way the ordinary features of a trust?—A. No. In the first place, we do not attempt to control the production in any sense whatever. We have absolutely nothing to do with production. Our members have, of course, but as an organization we have nothing to do with the question of how many orchards shall be planted or where. In the next place, we do not attempt to regulate prices—I mean to fix prices. We do attempt to regulate them to a certain extent incidentally. Our business is to try to get the best prices obtainable, but we do not attempt to arbitrarily fix prices. In fact, we have no f. o. b. California prices at all. Our goods are forwarded to our own agents in the different markets consigned to ourselves. We have our own offices in most of the important cities of the United States and we forward the goods to our own order. Upon arrival they are offered by our agent to the trade in the regular course of business and at the best price obtainable.

Q. Do the distributors sell on commission or on salaries?—A. They are usually salaried men. In some auction markets we pay a commission because that is the auction charge; but in almost all cases the salesmen are our salaried agents who have no other employment except for us. In a few instances we sell through brokers, where the market is not large enough to justify a salary and the consequent expenses of an agency. There we use the broker, allowing him the usual 5 cents per box for selling; but that applies, I think, to only 3 or 4 markets in the United States. We have some twenty-odd salaried offices in the principal cities.

Q. (By Representative LIVINGSTON.) You have an organization?—A. Yes.

Q. Then, I understand you to say you have your agents in all the principal cities?—A. Yes.

Q. And still you say you are not a trust?—A. I endeavored to explain why I did not consider we were a trust.

Q. Can the independent producer in California reach the markets of those cities where you have your agents in any other way except through you?—A. Yes.

Q. How?—A. Through the commission man, and through his own agents if he chooses to establish them.

Q. Through his commission agent?—A. Yes; or consign his goods if he prefers.

Q. You would not recommend any man to raise fruit to sell through commission houses?—A. I would not.

Q. That is practically out of the way, then. Now, how can that independent producer reach the markets of Washington, say?—A. A number of them use their own brokers in the city of Washington. They may sell through them in carloads by paying him the usual brokerage. I am not certain but 1 or 2 of them have salaried men here. I can not say positively.

Q. What advantage, then, have you over the independent producer? What arrangement have you with the railroads between here and California?—A. None other than anybody else can get.

Q. I asked what arrangement you had.—A. None whatever, except to pay the rate and make our shipments under the traffic arrangements established by the carriers.

Q. You get a rebate?—A. None whatever. We did at one period; so did every body else.

Q. Who belongs to your association?—A. None but growers of citrus fruits, oranges, lemons, and grape fruit.

Q. It does not include vegetables?—A. No vegetables. No deciduous fruits; no dried fruits. Perhaps I ought to say that some of our agents do, under our direction, sell some dried fruit and some green fruits for other similar cooperative

associations of growers; but the business is not under our control in California. The fruit is sold through our agents, for which we make a charge.

Q. Then, what advantage has your association in California?—A. The advantages that accrue to the producer are that we get our fruits sold at better average prices, and sustain smaller losses than under the commission system.

Q. Is that chiefly due to the fact that you have reliable agents in the towns?—A. Entirely so.

Q. (By Mr. LITCHMAN.) What portion of the traffic does your association cover?—A. About 50 per cent of the citrus fruits.

Q. Is there any objection to other fruit growers joining your association?—A. None whatever. They join as rapidly as they conclude it is to their interest to do so, and they are steadily joining.

Q. Do you encourage them joining?—A. We do.

Q. (By Representative LIVINGSTON.) I do not understand how it is that with such an association back of you you get no reduction in freights. Have you made application?—A. Yes. When I tell you that the initial carriers, the two railroads operating in California, divide the business between themselves and parcel it out to their connections you will perhaps understand why it is impossible for us to obtain anything in the shape of a reduced rate. There was a time in the history of the California business when almost every commodity had its special privilege or rebate in some form. But under the existing order of things, by reason of the arrangements between the carriers, the rate is firm.

Q. Can you charter a car?—A. No; we can load a car with its minimum load of 26,000 pounds and pay \$1.25 per hundred for it.

Q. (By Mr. KENNEDY.) I would like to know whether you consider the arrangement which now prevails, by which all shippers, great and small, receive exactly the same rates from the railroads, as more desirable than the old system under which rebates were given to different shippers?—A. I believe that a steady rate, one rate, is right. While I quite understand that an association as large as ours is very likely to get special benefits under shifting rates, I believe that in the interest of our industry, as well as of good morals, the steady rate is desirable.

Q. You pay the same rate per carload that independent shippers would have to pay, and still you have an advantage over them in that you avoid the commissions and make great savings on account of the system which you have?—A. Yes. There was another evil of the flexible rate. The rate was usually made, or the rebate usually obtained, through a private car line, several of which were operating in that traffic. Speculators, whose sole hope of reward was in the rebate on the car, dipped into the traffic. They would go to the producer and obtain from him, or make with him, a contract for handling his crop on the best terms possible—the best to the shipper usually—and proceed to farm that crop out to the carriers solely for the benefit of the speculator or middleman. The producer was none the better off for that rebate, and usually his crop was very poorly handled. The whole thing was extremely demoralizing to the business. It put the business into the hands of people who really had no right to be there, and who were not prepared to handle the business properly. They were what we called pirates in the business. The establishment of a steady rate eliminates that feature and puts that class of speculators out of the business. I do not, of course, pretend to include all independent shippers in that category.

Q. (By Mr. A. L. HARRIS.) You spoke of two railroads doing your carrying business. What two railroads?—A. The Atchison, Topeka and Santa Fe and the Southern Pacific are the two lines that operate as initial carriers in southern California.

Q. Do the same rates and same classification obtain on both roads?—A. Yes; the same rate. We have a postage-stamp rate on our goods—that is, the same rate prevails at all points east of the mountains on citrus fruits; not on other classes.

Q. (By Mr. LITCHMAN.) Your goods are classed as perishable and have to be expedited in transportation?—A. Yes.

Q. (By Mr. A. L. HARRIS.) What was the condition of your fruit industry before your organization?—A. The fruit was handled in a haphazard manner, largely through commission men. It was sent thousands of miles away to be sold, very largely for the account of the grower, and the method resulted in disaster. Occasionally good prices were obtained, but in very many cases the grower came out in debt; and that sometimes still happens with the grower who enters into a contract with a commission firm. The grower, guaranteeing all charges, including the freight charge, frequently came out in debt, so that he not only lost the entire crop, but was obliged to pay something additional for the charges covering the transaction. It was to avoid contingencies of that kind that we formed this cooperative association. Values were depreciated. The fruit-growing industry

was in a very bad way in every particular, although it was young and the product was very much less than it is at present.

Q. What is the condition of the industry now?—A. The industry is in a healthy and sound condition. It has its fluctuations, like a business in any other perishable product—all agricultural products for that matter—but is in a sound condition.

Q. (By Mr. LITCHMAN.) Does your association take into consideration the perfection of the fruit or the development of special kinds of fruit?—A. No; not as an association. Of course, through the association every sort of information is given to the growers as to what is desirable in the markets, what classes of fruit, what character of package and the manner of handling, and all that sort of thing; and therefore to a certain extent influences are brought to bear on them to do good work.

Q. How long has your organization been in existence?—A. We incorporated in 1895. Previously we had had a sort of compact among growers for a period of 2 years, during which time we operated in the manner known as selling f. o. b. California. At least we attempted to so operate, but with very poor success; and in 1895 incorporated our present corporation and established our own agencies to sell the fruit delivered, as we term it.

Q. How long has the navel orange been developed?—A. The navel orange was first propagated in California in the early seventies, and the product has been increasing steadily ever since. None were marketed to speak of until the middle of the eighties. In 1884 and 1885 the business began practically to assume importance.

Q. Are you sufficiently familiar with the fruit to explain briefly the method by which that orange was developed?—A. No. The first trees were brought by the Department here from Bahia, I think, and sent to Riverside to be planted; and from that beginning the entire navel orange business has been developed. But the manner of its propagation, in the first instance, I am not familiar with.

Q. Are there not now being carried on experiments to try to produce a lemon similar to the navel orange?—A. To a large extent our lemons produced in California are seedless, and that is the particular distinguishing characteristic of the navel orange. A very large proportion of our lemons are seedless. We also have other seedless oranges.

Q. (By Mr. A. L. HARRIS.) What is the capital stock of your exchange?—A. Our exchange is organized with the nominal capital stock of \$10,000. We have no capital stock paid up—no capital paid up except what we have in office furniture and fixtures in our different offices, amounting to a few thousand dollars. We have no reason to require any capital. We buy nothing except packing materials for the local exchanges who pay for them on delivery. We buy for everybody in large quantities, but we have no use for capital. At the end of the month we call upon these local exchanges to pay in what we estimate will be necessary for the current expenses of the month, and those accounts are adjusted at the end of the season, so that all fruit is assessed alike for these expenses, and all at the cost of operating.

Q. Is there another organization in the State of California that deals in prunes and raisins?—A. Yes; two of them. There is what is known as the Cured Fruit Association, which devotes itself chiefly to prunes, although I think they handle some dried peaches and other dried fruits. There is also what is known as the Raisin Growers' Association, which devotes itself entirely to raisins. Their organizations are cooperative, but they differ from ours.

Q. Could you state to the commission the difference?—A. They differ in this particular, that they undertake to establish a price f. o. b. California for their products. It is an arbitrary price fixed by the association at which the product is to be sold. In other respects they are similar to ours—purely cooperative.

Q. What was the condition of the prune trade and raisin trade previous to the organization of these two companies?—A. They were both in very bad condition, very bad indeed.

Q. What is the condition of these industries at the present time?—A. The raisin association, having operated some 3 years under its present form, has done a very good business. They are not without some troubles of their own, but have demonstrated that organization is a good thing. The prune association has had very great difficulty. They began their operation this last year, and the product was very large. There was also a large product in Oregon which they did not control, and rather a large quantity outside of the association, and the establishment of prices f. o. b. California enabled the outside holders to shade the association price and market their product, while the association held a very large proportion of its product. I think it is fair for me to say to the commission that I personally do not regard the attempt to fix an f. o. b. price as practicable, and I think it is

the source of the difficulties that both of those associations have had, it being our impression that we must market these products at whatever price the consumers will pay. We must find out what that is and market the fruits anyway, if not at one price, at some other, and we can only do that by putting them into the market to be distributed through the distributing channels now in existence at the best price obtainable in competition with other products.

Q. Has your association increased the average price of citrus fruits to the consumer?—A. I doubt whether the effect of our association has been at all to increase the price to the consumer. We did not organize with that end in view. We never contemplated that we should increase the price to the consumer, but our object was to save the losses and lessen the expenses between ourselves and the consumer in the handling, and of course to create a wider distribution and consumption of the product. We are obliged, of course, from year to year, to sell our fruit at lower prices. With the increase of the product the level of prices goes lower from year to year.

Q. (By Mr. FARQUHAR.) Have you any market for California fruits in the Asiatic countries?—A. Not to speak of. There is opening a limited market.

Q. Have you in any other of the coast States—Washington or Oregon—a market for your California fruit?—A. Yes; we market at all points in the United States and quite a quantity in Europe.

Q. Do you find a market in Washington and Oregon?—A. Yes; we market quite a quantity of citrus fruits there.

Q. Have you any prospects at all for Asiatic trade for your fruits?—A. Yes.

Q. Have you made an attempt to make a market in the Asiatic countries?—A. Yes; but citrus fruits not extensively. There are some efforts to make a market at Asiatic points. The difficulty in operating there is the long sea voyage. Our fruits don't stand the long voyage as well as the Mediterranean fruits.

Q. Do you can any of your fruits?—A. There are vast quantities of canned fruits going to the Asiatic countries. I had reference more particularly to citrus fruits.

Q. The whole market?—A. Yes; there is a large quantity of California fruits going to the Asiatic market.

Q. During the Boer war have you found a market in South Africa for any of your canned fruits?—A. Without referring to the report of the State board of trade, I should not be able to answer that question.

Q. How extensive are your canneries in California? How much of the product do the canneries take up? The Asiatic trade in fruits, canned and otherwise?—A. The exports of fruits of all classes including canned fruits from Pacific coast ports to foreign countries for the fiscal year ending June 30, 1898, show an exportation of \$1,721,000 worth, but I have not with me the figures showing to what countries these exports were made. I am, therefore, unable to say how extensive our Asiatic trade in fruits is. The total Pacific coast exports of all classes of merchandise to Asiatic countries for the fiscal year ending June 30, 1898, was nearly \$17,000,000, a gain of over 400 per cent in 5 years.

About 10 per cent of our shipments of fruits out of the State are canned fruits. There are about 50,000 carloads per annum shipped out of the State of green citrus, dried and canned fruits, of which about 5,000 carloads are canned. It is impossible for me to say what proportion of the green product those canneries consume, as I am not an expert in canning, and I am, therefore, not able to say what the loss is.

Q. Would the enlargement in the establishment of your canneries also enlarge the possibilities of the marketing of canned instead of being dependent on the green fruit in market?—A. I should say they would; yes.

Q. Is there any Australian market that you know of?—A. I think none except in canned and dried fruits. The transportation rates are against us.

Q. One of the defects you have in the Asiatic trade is the lack of tonnage transportation?—A. Well, we can get to Japan and China, but we can't get to the South Sea countries because the freight rate is against us as compared with the freight rates from England.

Q. Do you know whether there is any market for your goods, canned or otherwise, in Alaska?—A. Yes; there is quite an extensive market. A considerable quantity of our green fruits, especially citrus fruits, is shipped to Alaska. Of course it is not a large quantity, but there is a large canned and dried fruit business in Alaska.

Q. Have you sufficient coastwise transportation for those markets?—A. Yes.

Q. (By Mr. A. L. HARRIS.) You have a topical plan that you expect to follow. You may take up the topics seriatim and discuss them if you wish, and the commission will ask questions as you go along.—A. The first item here is the peculiar conditions on the Pacific coast. We are large producers of cereals, but our chief

industry probably is not staples, after all. Ours is a semitropical country, and we produce so large a variety of fruits that the agricultural and even the horticultural conditions that prevail usually are not applicable to the Pacific coast. The climatic conditions of the Pacific coast are such, as I have already noted, that we produce almost everything. I think I perhaps might say that commercially we produce practically everything except the purely tropical products, so that the conditions that apply as to labor, wages, and questions of that kind, including transportation to other portions of the United States, are not entirely applicable to ours. The Pacific coast, as you are, no doubt, aware, is not a manufacturing country. There is a considerable amount of manufacturing at certain points, as, for instance, in San Francisco, but the whole coast is dependent more upon its minerals, its agricultural and horticultural products, and lumbering than it is upon manufacturing.

Q. (By Mr. LITCHMAN.) Is the manufacturing industry retarded by lack of transportation facilities?—A. Yes. Perhaps I should say by the condition of the freight rates more than the lack of carrying facilities.

Q. Then the fact that you have a comparatively limited amount of manufacturing on the coast is due to other causes than necessity for their existence?—A. Yes; because we are heavy importers. In proportion to our population we are perhaps as heavy importers as any country in the world.

Q. (By Mr. KENNEDY.) Is it an even thing, the exchange of manufactured goods of other sections with your California products?—A. Only within the last 3 or 4 years have our exports exceeded our imports. I think the last 1 or 2 years we have gained very materially, so that our exports have exceeded our imports by nearly 50 per cent. Within the last 3 or 4 years that has been the case, the first time in the history of the Pacific coast. Now, I speak particularly of California as to the volume of the business, but I think the same remark would be applicable to the country north of us.

Q. So, then, you are not in any unenviable condition for lack of manufactures in your State?—A. No. Of course if we were in a situation to produce these things ourselves we would save a big freight bill.

Q. All the grist would come to your mill, and nothing would go away?—A. Largely that would be offset because of the fact that considerable proportion of the raw material would have to be imported anyway, as we do not produce all the necessary raw materials.

Now, as to fruit growing in particular: This industry has grown in the past 10 years to very large proportions. I think I can give you some figures on that. The fruit business, including the product of our vegetable farms and vineyards, has increased about 400 per cent in 10 years. We exported, as I think I said before, about 50,000 carloads of fruits during the year 1900. That was exclusive of about 3,500 carloads of vegetables and probably 7,500 carloads of wines and brandies. These are rail shipments. The sea shipments of fruits and nuts amount to about 3,000 carloads, with a small shipment of the other products that I have named, but comparatively light.

Q. (By Mr. A. L. HARRIS.) You spoke a moment ago of the cereal industry not being developed so rapidly. Could you state what the production is at the present time?—A. Yes, sir. The California wheat crop in the year 1900 was a little over 973,000 tons. I am not sure that I have the other cereals excepting barley. The others are comparatively small, the wheat being the chief cereal. The exports of barley from California in 1900 were 212,000 tons.

Q. (By Mr. PHILLIPS.) You do not raise much corn?—A. Very little corn, so little as not to be counted.

Q. You do not consider your climate well adapted?—A. It is not; no, sir. We have our wet and dry season, and our dry season is the winter and spring when the wheat is growing. The summer is too dry for corn. There are no rains to make a corn crop. There are limited areas of moist lands in certain portions of the State that will produce corn. They are near enough to the water level to produce it in limited quantities. The other portions of the Pacific coast farther north produce quite a quantity of corn, because they have a longer rainy season. Oregon and Washington both produce a considerable quantity of corn, although it is not primarily an important product.

Q. (By Mr. A. L. HARRIS.) Have you any grazing industry in California?—A. Oh, yes; extensive. Our stock interests are quite large, including cattle and sheep and horses. The wool product of the year 1900 was estimated at 27,500,000 pounds. We also have somewhat extensive beet-sugar industries on the Pacific coast, particularly in California. I am not sure that there are any beet-sugar factories outside of California on the coast except in the mountain country.

Q. Can you give the volume of the product of beet sugar?—A. Yes. Beet sugar in 1900 was 30,000 tons; in the year before it was 42,000 tons. The crop

was nearly a failure last year in southern California where there are 2 large factories, by reason of the drought. The beets are grown in moist lands.

Q. Does that mean refined sugar for the market?—A. Yes; refined sugar.

Q. Is it a profitable industry?—A. I think it is regarded as profitable. The farmers who have been engaged in beet raising, I think, with the exception of the dry season, have had uniformly profitable results.

Q. (By Mr. FARQUHAR.) Can it compete with Hawaiian sugar?—A. It does.

Q. Is your beet sugar pretty much for the home market, or do you send it East?—A. A good deal is shipped out.

Q. (By Mr. A. L. HARRIS.) Will you please state the firms operating in the beet-sugar business?—A. There are, I think, 6 or 7 factories in California. There are the Chino and Oxnard establishments, both operated by the Oxnard company; the Alamitos, owned by Senator W. A. Clark; the others, the Watsonville, Spreckels, Alvarado, and perhaps Crockett are, I think, all owned by Spreckels. I am not positive of that, however. They are farther north and I am not so familiar with them.

Q. Is there a sugar combination in your State?—A. I do not know; I am inclined to think there is, but I am not prepared to say advisedly that there is.

Q. You spoke of nuts a moment ago. What is the extent of that industry?—A. About 700 carloads last year of about 12 tons to the carload. They are chiefly English walnuts, although there are some almonds. That industry is growing quite rapidly. The product is increasing; it is a very profitable one.

The WITNESS. I have a topic here, "The cost of land," following the suggestion, I think, in the topical plan your commission sent me. Probably nowhere else on the continent are the prices of land so variable or divergent as they are in California. They run from very low to very high. We have, of course, a vast area of mountain lands, broken and hilly, and also a large area of desert lands that are practically worthless and on vast areas of which there is no price whatever. From that, of course, it ranges up through the grazing lands to the highest priced fruit lands.

Q. (By Mr. PHILLIPS.) Can there be sufficient water obtained to irrigate those arid lands to any considerable extent?—A. Yes; I should say that there can be. By extensive dams and reservoirs large portions of them can be irrigated, but probably never anything like all of the land or even approximately all of it.

Q. (By Mr. A. L. HARRIS.) Where is the title of this mountainous land and hilly land?—A. Much of it is in the Government of the United States, some of it is railroad land, and some of it school land, two sections in a township being school land. The Southern Pacific Company owns large bodies of land in these deserts and mountains, included in the grant made to promote the building of the road; but the larger proportion of it, I should say, is Government land. Then there are some regions that are covered by Mexican grants which are now in private ownership. Somewhat extensive these are, amounting in some cases to very large districts. Then there are some other very large estates.

Q. (By Mr. PHILLIPS.) Do they pay any considerable tax on these large estates, mountain and desert?—A. The desert lands are valued at a very low rate, extremely low, although I think they are usually taxed in proportion to their value with other property.

Q. (By Mr. A. L. HARRIS.) These large holdings are under the Mexican grants to this Government?—A. Yes; distinctly. Those are being cut up to a considerable extent. Especially where there is water to irrigate them or water obtainable, they are being put into diversified farming, fruit raising, etc., to a considerable extent. Very large areas of these grants, however, are grazing lands. They were originally granted about a pool or a spring, or a stream of water, and the prayer for the grant was to cover so many leagues in this direction and to "a stone" or "a tree" in the other direction and, of course, they swept over the country and took in grazing districts as well as watered lands. Those that have water possible for use for irrigation are generally used for that purpose.

Q. Are these land grants an inheritance on the part of the United States from Mexico?—A. I think entirely so; I so understand.

Q. (By Mr. FARQUHAR.) You say these Mexican claims are being gradually broken up, you think?—A. Yes; where there are waters for use for irrigation they are being broken up.

Q. Are the owners of these Mexican reservations residential owners or are they nonresidents?—A. Oh, they are seldom residents upon the lands. These large grants are usually held by San Francisco people who do not live on them.

Q. Is it a fact that some of these large grants are really hypothecated to rich California people?—A. Oh, yes, oh, yes; they are largely owned now by people who have acquired them by foreclosure and other cheap methods, even cheaper

than that in some instances. The original holders being Mexicans were improvident and really squandered them for riotous living; that is about the way of it.

Q. (By Mr. A. L. HARRIS.) You did not state in dollars and cents the value of the land.—A. Grazing lands are worth from, say, \$2.50 to \$10 per acre. Lands upon which cereals can be grown are worth from \$15 to \$50 per acre. Fruit lands with water are worth \$100 to \$400 per acre, dependent on the extent and reliability of the water system and supply, and upon the nearness to markets, quality of the soil, character of the fruit they will produce, freedom from frost, and things of that kind.

Q. (By Mr. LITCHMAN.) Do you grow any other crop on the ground beneath the fruit trees in the orchard?—A. Not to any extent; no.

Q. (By Mr. FARQUHAR.) Where is your best fruit-growing section in California?—A. That depends on the kind of fruit grown. For instance, probably about the best prune section is the Santa Clara Valley, which runs southward from San Francisco in the region of San Jose. The best raisin district is in the upper San Joaquin Valley about Fresno. The best pear district is on the Sacramento River, between Sacramento and the bay. The best orange and lemon district is south of the Tehachapi Mountains in the southern tier of counties.

Q. (By Mr. LITCHMAN.) In the vicinity of Los Angeles?—A. Yes; but the interior valleys back from the seacoast are really the better districts for citrus fruits. There they are freer from the scale and the effects of sea moisture.

Q. (By Mr. FARQUHAR.) What effect has the California fog upon your fruit growing?—A. It has the effect on the citrus fruits of producing a scale, particularly a black scale, a snout which, although it is a fungus, flourishes particularly in damp weather and in foggy periods. It propagates very rapidly. When the hot summer comes on it almost entirely clears itself. Then, again, it is found that the citrus fruits grown in the interior valleys are somewhat more firm in their keeping qualities; that is, will carry long distances with greater safety.

Q. (By Mr. LITCHMAN.) Will you state the fruit-gathering season?—A. The deciduous fruit is gathered from May to October. They are now beginning actively the green-fruit shipments out of California. The cherries are gone, and peaches, apricots, and plums are now coming forward, particularly the peaches and apricots. The plums and pears and grapes follow right on, the peaches continuing, of course, through to September. The drying of the same class of fruits is going on at the same time. The raisins are cured in September and October. They are made out of the same class or, at least, one of the varieties of grapes which are shipped to market in the green state, although that particular variety is in a rather limited quantity used in the market. The citrus fruits are shipped from November to July chiefly, although some oranges are shipped every month. The lemons are shipped continuously, but chiefly from the 1st of June to the 1st of November.

Q. (By Mr. A. L. HARRIS.) Have you been troubled with insect pests?—A. Yes; we have had a good deal of trouble. First we had the cottony cushion scale; afterwards the red scale, and then this black scale. The black scale is, however, less detrimental to the orange trees than the others. Those are the pests that particularly affect the citrus fruit trees.

Q. (By Mr. KENNEDY.) What is the one they call the San Jose scale?—A. That affects the pears, peaches, plums, and prunes, and that class of fruits. I am not familiar with the San Jose scale particularly, as we are not annoyed with it in southern California. The others affect our citrus fruits. But we have almost or to a large extent gotten rid of the cottony cushion scale, it having been destroyed by the Australian lady bug, which was imported and propagated in California. The only satisfactory protection so far against the red scale is fumigation.

Q. (By Mr. LITCHMAN.) Are oranges and lemons grown in the same orchard?—A. Yes.

Q. No effect from one on the other?—A. None whatever; lemons are slightly more sensitive to cold than oranges, and consequently the aim is to put the lemons on the ground that is as nearly as possible immune from frost. The tree is a little more tender and the fruit a little more sensitive than oranges.

Q. How near the ripened condition is the fruit when picked?—A. Oranges are entirely ripe—that is, except at the beginning of the season we ship some fruit for the holidays that is not ripe, when they simply have some color on them. The demand for the fruit causes it to be sent forward. But from, say, the end of January on, the fruit is ripe, all of it in perfect condition. Lemons are sent forward regardless of color. They are not presumed to be colored. They are presumed to look green when they are picked. They are picked when they are of proper size and are cured to a certain extent before shipment—that is, they are sweated down in a cool place. The green fruits, such as apricots, pears, and prunes, and

that class of fruits, must be picked in a rather immature state. They are not at their best when picked—that is, if for long shipment.

Q. (By Mr. KENNEDY.) Is the Agricultural Department giving you any valuable aid looking toward the extermination of the scales?—A. Yes; the Department has rendered us assistance, although the chief work has been done by our own horticultural commissions established by the State. We have sent men abroad to study the pest destroyers of almost all fruit-growing countries.

Q. (By Mr. A. L. HARRIS.) Is your State law ample for the commission?—A. Yes; we have a very effective State law on the subject of pests and the power of the State to subdue them.

One more word on this question of irrigation. For the growing of citrus fruits irrigation is absolutely indispensable; consequently the question of water and of an irrigation system is of very great importance to that industry. The water itself is the chief element of cost, the land being of small value without the water. Of course the land and water together are of very considerable value.

Q. (By Mr. A. L. HARRIS.) Can you state also whether the irrigating is done by private corporations or by the public?—A. It is done almost entirely by private corporations and individuals.

Q. How do they obtain their right to the water?—A. Chiefly by appropriation. Under the riparian law, the general riparian law with the modifications that are made by the States, the individual who finds a water source or a stream, or has lands upon which he can take it for irrigation, appropriates so much as he may think he requires for his land, and if he proceeds to distribute it and use it, will hold so much as he uses against adverse claimants. It is, in other words, a prior appropriation.

Q. Does that right, then, run with the land?—A. Yes, in some cases. Of course, waters are developed by artesian wells, and the water is sold to individuals and becomes, in some cases, an easement upon the land. Sometimes the lands are sold with the easement running with them. Sometimes they are sold separately. It is a matter in cases of that kind largely of contract.

Q. (By Mr. KENNEDY.) Are artesian wells where the water is impregnated with minerals beneficial or otherwise to the land?—A. The water is seldom detrimental to the soil. Of course, if it should be salty it will not do for irrigation; or if they are strongly impregnated with alkali it is not suitable. But that is seldom the case with artesian water. It is true frequently of surface waters, but true very seldom of the artesian water or the deep waters. They are suitable usually for all crop growing, as well as for domestic purposes.

Q. Are artesian waters being used for irrigating large tracts of land?—A. Yes; there are some quite extensive artesian belts where the water is obtained, where there are flowing wells of large extent. Of course, there is a vast amount of pumping done also. Where the water is abundant below and will not rise to the surface powerful pumps are employed. I think it was estimated that within the last 2 years more than 30,000 inches, miners' inches, of water were developed in southern California by pumping. That, of course, would irrigate a large area.

Q. (By Mr. A. L. HARRIS.) If the Government should inaugurate a general plan of irrigation, would that interfere with the riparian rights already obtained?—A. I hardly think so, because the Government's undertakings would probably be in undeveloped sections and would be more probably in the nature of storage by reservoirs, dams, etc., because the larger proportion of the streams that could be used by individuals or private corporations are already appropriated, although that is not in every instance the case. I hardly think there would be any material conflict anywhere.

Q. Now you may proceed.—A. The labor conditions in California, like the other conditions I have mentioned, are rather peculiar. The crops are coming at all seasons. There is practically no season when the fruit harvesting or the grain harvesting, one or both, are not going forward. Until recently we have had an ample labor supply. A considerable portion of that, of course, is made up of Chinese and Japanese labor employed chiefly in agricultural pursuits of every kind, in fruit gathering and packing. More recently we have had a shortage of labor. The wages are variable, according to the character of the work. Fruit packing is, to a certain extent, skilled—that is, it requires skilled labor. In order to put up fruit in the best shape and in merchantable condition it requires some skill. This work is largely done by girls and women during the fruit-packing season. The farm labor is chiefly by Mexicans and white men.

Q. (By Mr. KENNEDY.) Are the Chinese and Japanese getting into the industry?—A. Only to a limited extent in general farming. They are getting into the fruit growing.

Q. I mean into the fruit growing.—A. Yes; into the fruit growing, especially into the deciduous fruit-growing business and the making of dried fruits. They

are not engaged to any extent to speak of in the citrus fruit growing. In central and northern California they are tenants of very considerable tracts, of a very considerable number of farms and fruit orchards.

Q. How are they viewed as farm laborers and landowners?—A. For fruit growing they are regarded, I think, generally with favor, due in part, I suspect, to the fact that there is but little difficulty in obtaining help of that class, and it is very difficult to obtain any other. The man who has a large fruit ranch, as we call the farms in California, is not obliged when he wants Chinese help to go and hunt men around the street corners and pick them up one by one. He goes to a Chinese labor bureau, or to one of the Six Companies usually, and hires the number of men he wants for a given time and period; that is, to begin with a given date and to continue for so long as he may require.

Q. They show an aptitude in this work?—A. Decidedly. They are the best fruit packers we have. Fruit growers in central California tell me it would be practically impossible for them to harvest their fruit crops without the Chinaman. They can not find other people that will properly do the work.

Q. How do the fruit growers of California view the Chinese exclusion act?—A. I think they are generally in favor of the law as it stands.

Q. Would they be in favor of a continuance of it at the time of the expiration?—A. I think so. Under the present condition of things, I think it is regarded as in the nature of a safety valve.

Q. Do you believe the Chinese and the Japanese would ever be treated on a social equality?—A. Never. They show no inclination, so far as I have ever observed, to desire to be.

Q. They would always be viewed as inferiors socially by the people of California?—A. They are not regarded differently from the Indians or Mexicans of that country in that particular. They have no social status whatever.

Q. Regardless of their value in your industry at the present time, do you believe that it is desirable to our civilization that they should come into this country?—A. I do not.

Q. (By Mr. A. L. HARRIS.) Who receives the pay when these Chinamen are employed?—A. Usually the head man—either the party or the bureau that contracted for their employment or the foreman that they send out. When they go out in squads there is usually some fellow that is the foreman, and he probably gets the pay. Of course, there are many cases in which Chinamen are employed as domestics or employed singly about farms, and they are hired separately.

Q. (By Mr. KENNEDY.) Where they are engaged in that wholesale way and one man is paid the wages for all, do you consider they are in a condition of practical slavery?—A. I do not think so. I think it is a purely voluntary arrangement among themselves. I do not pretend to know how that is, of course, but I do know that the Chinamen so engaged always have money at night or on Saturday to gamble all the night or all Sunday with. They are great gamblers, and they all have money.

Q. Can you say anything about the diet and the cost of living as farm laborers?—A. It is extremely cheap. They live usually for the most part on rice. When they go into the city, of course, they are meat eaters and fish eaters, and particularly pork eaters; but when they are out engaged in contract work or ranch work they invariably feed themselves, and usually rice is the chief article of diet.

Q. (By Mr. FARQUHAR.) Do you know of any Chinese companies there that hire gangs of men and work them?—A. Yes; that is exactly what I have mentioned. The Six Companies are always prepared to contract for any number of men.

Q. In California, your first opposition to the Chinese was political, was it not?—A. I think it was.

Q. What is the present frame of mind in California with respect to this Chinese labor?—A. I think there is comparatively little friction there at present. I think, for the most part, the fruit growers, packers, canners, and people engaged in various other lines, regard the Chinese as almost a necessity, because of the insufficiency of other labor and the indisposition of other people to labor. I have been told by canners that it would be impossible for them to run their canneries without Chinamen, under the existing order of things; they would be harassed continually by strikes and shortage of labor that would make it impossible to get the work done. The people of California like to have it easy; they are not fond of more work than is necessary. I do not mean by that that farmers, ranchers, and fruit growers are not workers, because they are. I mean the class that usually is found to do odd jobs, are unwilling to do much of anything in that country.

Q. If the question could be put to the people of California in a body, do you think they would vote for or against the extension of the Chinese exclusion act?—

A. I think they would be for the extension. I do not believe the people of California or the Pacific coast have any desire for an increase of the Chinese population. I think the vote would be decidedly in favor of the continuance of the exclusion act. They have no disposition, however, to force out of the country those that are there. They are a peaceable people; they are very seldom disturbers of public order.

Q. Have those that have been some time in California ever taken up the form of the family and become permanent settlers?—A. In a few instances only, and they are confined entirely to the cities. The Chinamen that are scattered over the country, in many cases, have become owners of fruit ranches themselves, and are industrious and frugal; but they live alone in a crude manner with no family relations whatever.

Q. (By Mr. KENNEDY.) Have the people of California any dread of leprosy or the bubonic plague and like diseases from these Oriental people?—A. I think not. There is some little dread in San Francisco, it is true, but outside of that city there is practically no fear of that kind.

Q. (By Mr. A. L. HARRIS.) What is the average wage that Chinamen demand?—A. About \$1.25 a day for work in fruit growing and packing and like work. Sometimes the work is done by the package, but, as a rule, the wage is about \$1.25 a day, when the white man's wages would be \$1.50 to \$1.75. That is about the relative wage, but wages have recently advanced, and I am unable to say what they pay the Chinamen now. We have to pay other common laborers for fruit picking and things of that kind \$1.75 a day.

Q. With or without board?—A. Without board when it is by the day. By the month, the year round, we pay from \$25 to \$40 for farm and ranch laborers. We call an orchard a ranch.

Q. (By Mr. KENNEDY.) You say you pay the Chinamen on an average \$1.25 a day. Will he live on as little as 25 cents a day?—A. I think so.

Q. So that he will have a saving of \$1 out of his wages?—A. I would say a Chinaman has \$1 saving out of his \$1.25.

Q. Can an American supporting a family compete with such labor at all?—A. Hardly; although, as I say, the American gets more wages. The American will get about \$1.50 to \$1.75 to the Chinaman's \$1.25. When these contracts are made for large numbers of Chinamen on certain classes of improvements, I think they get them as low as \$1 a day. Chinese domestics get from \$1 to \$1.25 a day, cooks and those doing general domestic work getting from \$30 to \$35 and as high as \$40 a month.

Q. (By Mr. A. L. HARRIS.) Are these Chinamen employed by railroads?—A. The Chinamen do more or less contract work. Then they are, in some instances, section men on the railroads. They are employed in no other capacity, so far as I know, except as cleaners or something like that. They use more Mexicans for railroad section work.

Q. (By Mr. KENNEDY.) As domestic workers do you mean they do the general housework that would be done elsewhere by female labor?—A. Yes.

Q. Is that a general thing in California?—A. I should hardly say general, although it is very common. Many people prefer the Chinamen as domestics, because as a rule the Chinaman will do more than any woman, and he does not object to any part of the work. He is usually faithful, and seldom cares to run about much. With many people he is really a rather desirable domestic.

Q. (By Mr. A. L. HARRIS.) Have you anything else in mind?—A. The matter of transportation and the freight rate are very important to us. It is a very long distance that our products must be transported, and over a country that produces no local traffic, and over mountain ranges where railroads are expensive to operate. Our products must find a market by going long distances, and as the bulk of them must be shipped by rail (although we have an extensive sea coast), the freight rate is a very important factor. It is a very important factor to us in both directions, because much that we consume must be hauled over these same mountains and deserts.

We have experienced to a certain extent an insufficiency of transportation facilities that has been particularly marked in the last 2 years. Last summer the green-fruit shippers were unable to market all of their product for want of transportation. We have been unable this year to market all our oranges. The railroad people themselves have given me the estimate that we lost 3,000 carloads of oranges for want of transportation facilities. I am myself gathering statistics on the question, but have not yet completed them. I give these figures as the estimate of the railroads.

Q. (By Mr. PHILLIPS.) Did you lose any at the place of loading?—A. We lost some at the packing houses, and thousands of cars probably fell on the ground in the orchards, and could not be shipped at all.

Q. When the fruit is delivered do you generally get prompt shipment of it?—A. Not by any kind of means prompt shipment, and in some instances none. In some instances the fruit was packed in the boxes ready for shipment, and in some cases it was repacked, and in other cases it was thrown away entirely.

Q. Had you no redress for that loss?—A. We are not certain of that. We are trying to figure that problem out right now to see whether we have or not. The conditions grew out of several circumstances. The particular difficulty this year was a shortage of motive power, and inability to haul the fruit. We ought to have out of southern California, from the middle of January to the 1st of May, an average of about 300 carloads per day going out. The railroads were entirely unable to haul that quantity. They hauled an average of about 150 cars per day during a portion of that time, and some of the time fell down to an average of about 120 cars. A part of that difficulty at least was apparently due, or was so claimed by the Santa Fe railroad, to a coal strike on their line. I am willing to concede that that was to a certain extent a correct explanation, but it did not account for the condition entirely, as the road was short of engines to haul the trains.

Q. (By Mr. A. L. HARRIS.) Are the railroads making an effort to supply this deficiency?—A. Yes; I think they are. I recently had an interview with the presidents of both the roads—President Hayes, of the Southern Pacific, and President Ripley, of the Santa Fe, and they both assured me that we should experience no more difficulties of that kind; that they would make ample provision for the transportation of our product. I may say, however, that we have had some previous trouble and have had some good promises in the past; but I am inclined to think that in this instance they will make a vigorous effort to provide the necessary engines.

Q. (By Mr. KENNEDY.) Part of the difficulty, you say, was a strike on the Santa Fe system. Did they also inform you that it was partly due to the general prosperity of the country which taxed their transportation facilities?—A. Yes; they said that was the state of the case, which I have no doubt was true, although we are not prepared to admit that as a very satisfactory apology, because they had ample notice that this crop would be presented to be moved.

Q. (By Mr. FARQUHAR.) Was there any better paying freight than the fruit crop?—A. Most of the other classes are hauled at a much less rate, and some of them on equally good time. Of course, they claim that our fruit has to be hauled on expedited trains, and consequently is very expensive to transport. But one of the difficulties we experienced this year was that they were not able to haul it on any expedited service.

Q. (By Mr. LITCHMAN.) How long does it take to get a carload of fruit from California to New York?—A. Ordinarily in previous years it would take about 12 days. This year it took as high as 20 days and 25 days, and much of the fruit arrived rotten.

Q. Do you think that delay was purposely done?—A. No; I do not think it was purposely done, but I think a measure of it was due to indifference.

Q. (By Mr. FARQUHAR.) What kind of cars are mainly used in the transportation of your fruit?—A. Refrigerator cars entirely. That is one of the factors in this problem. These refrigerator cars are under private ownership and are operated under contracts with the carriers. The initial carriers have entered into these contracts with the private car lines, and the carriers get the cars at practically no cost to themselves, in lieu of which the car lines are permitted to make a refrigeration tariff that is excessive and the carriers collect it for them out of the shipper. It is proper to say that we attacked this condition of things before the Interstate Commerce Commission, and we have a case pending there now for decision.

Q. (By Mr. LITCHMAN.) Have you been able to discover any identity of interest in the ownership of the railroads and of the car company?—A. I can not say that I have.

Q. (By Mr. FARQUHAR.) Do you know what length of time these contracts last?—A. The contracts expire in the autumn of 1902, and we have the promise of the railroad management that they will not be renewed.

Q. (By Mr. A. L. HARRIS.) How many refrigerator car companies have you?—A. During the life of the present contracts there have been 3; the Santa Fe refrigerator line, which is more or less under cover of the Santa Fe Railroad itself, they owning a part of the cars and leasing part of them; the C. F. X. line, which was owned by Edwin T. Earle, who was also the head of the Earle Fruit Company operating in the fruit business; then the Armour car lines, known as the Fruit Growers' Express, the cars belonging to Armour & Co.

Q. (By Mr. PHILLIPS.) What does C. F. X. mean?—A. California Fruit Express.

Q. Do I understand these refrigerator cars are used to carry both fruits and meats?—A. No. They are operated in the fruit and vegetable business exclusively.

Q. Then they must return empty?—A. They return to a certain extent empty. They hold them for west-bound freight, and up to last year very few of them went West empty. Then we had a scarcity of cars, because they held them for west-bound loads, but this year a good many have gone West empty. However, the freight business west bound, especially since the Spanish war, has been very large, so there has been some class of freight almost all the time to load a very large percentage of these cars with when west bound.

(Whereupon the commission took a recess at 1 o'clock until 2 o'clock p. m.)

Q. (By Mr. A. L. HARRIS.) What have you to say in regard to your Japanese labor, its efficiency and desirability?—A. I think the Japanese labor is in less favor for common work than the Chinese. The Japanese want the light jobs, and the house places, and things like that, although some of them do the other work, such as fruit picking and packing. There are fewer of them with us, of course. They are classed much the same as the Chinese. They want to live in a little better style, and they are more particular about the class of work they do.

Q. (By Mr. LITCHMAN.) Do the Japanese adopt American habits more than the Chinese?—A. Yes; more than the Chinaman.

Q. American dress?—A. Oh, yes; many of the Chinamen do that, many of them, except that of course, they are distinguished for their cues; they double it up under their hats, but many of them wear American clothes.

Q. The Japanese discard them generally?—A. Yes. The Japanese dress exactly like Americans, and their habits are about the same.

Q. Is there any appreciable number of Japanese or Chinese born in this country? They have been here long enough for that, have they not?—A. I should say the number of births is comparatively small. In San Francisco and in Los Angeles there are a few Chinese women, and they bear children, but the number is not increasing at all rapidly. Outside of San Francisco there is not a large number of them.

Q. (By Mr. A. L. HARRIS.) Are the Mexicans desirable?—A. No; the Mexicans don't want to work at all, and they will not work so long as there is a little of anything in the house to eat, or their stomachs are full; that is the rule. I do not mean to say there are no exceptions to that, but the Mexican is chronically indolent and indifferent. I speak now of the Mexican pure and simple. I do not speak of the Spaniard, because he is a somewhat different type.

Q. (By Mr. LITCHMAN.) Please give us something more concerning the refrigerator cars and the use of them under contract between the railroads and the car companies?—A. Under those contracts, as I said, the refrigerator lines agreed to furnish to these initial carriers a certain number of cars, and a certain additional number if called upon to do so. The initial carriers pay nothing for those cars for carrying the deciduous fruits, the green fruits as we call them; they pay nothing in the way of rentals or mileage. The car companies maintain the cars, keep up repairs, pay insurance and taxes, and get no mileage until the cars reach the terminal of the Southern Pacific or a corresponding point on the Santa Fe. In the citrus-fruit traffic they get three-quarters of a cent per mile, which is the usual refrigerator mileage, one way, to these same points. Of course after leaving those points or getting on to connecting lines, they have the usual rate of mileage. I think I said that the refrigerator companies must have their compensation somewhere, and they get it out of an excessive refrigerator tariff, which the initial carriers collect as a part of the expense bill and pay over to the refrigerator companies.

Q. (By Mr. KENNEDY.) Can you say how often a car should be rerefrigerated in going from Los Angeles to New York in a 12 days' trip?—A. Say it is going by the Southern Pacific, it would first be refrigerated at Los Angeles, again at Truckee or Boca, up on the mountains; at Ogden, and once between Ogden and Chicago, according to the line it went over, or at or near Chicago, and possibly once between Chicago and New York—not certainly—it depends upon the amount of ice that is in the bunkers at Chicago.

Q. (By Mr. LITCHMAN.) And somewhat, I suppose, upon the weather?—A. Yes; a good deal on the weather. If it is comparatively cool weather one or two of these icings may be left out.

Q. Can you give the expense of refrigerating a car?—A. For 3 years, I think, we operated cars for our own benefit—leased them—and I had charge of the operating for the benefit of our organization. It enabled us in that particular to compete on a level basis with the Earle Fruit Company, which had a car line, and

with another fruit company, which was understood to have the benefit of Armour's line. We found that the average cost of refrigeration in our business was about \$46 per car.

Q. From California to New York?—A. To destination. The Chicago rate is \$75 per car. We found on that \$75 rate it cost about \$46 per car; on the \$90 rate I think it cost about \$50 per car to refrigerate; the balance was profit.

The deciduous fruit, or the summer fruit, costs more. The weather being hotter more frequent refrigeration is required; and the rates are much higher than on citrus fruits. As it now stands the refrigerator rate, the maximum rate, to Boston is \$95.

Q. I do not quite understand what that \$95 covers?—A. The \$95 rate covers Boston, Hartford, Portland, Me., Providence, St. Johns, Quebec, and all New England points.

Q. Well, you say \$95 for what?—A. For the refrigeration—for the icing of the car. Formerly the rate to these points the refrigerator tariff was \$90, and on that \$90 rate, as I now recall, our cost of operating was about \$50 per car, leaving the balance profit.

Q. Will you go one step farther in that same connection and tell what the freight rate per car was to the same point?—A. The freight rate to the same point per car is approximately \$325. It is \$1.25 a hundred on a minimum of 26,000 pounds. Of course, if we put more than 26,000 pounds of fruit in a car it is \$1.25 on the additional, but the 26,000 pounds will make \$325 and odd cents, I believe.

Q. That is to say, it costs you \$325 even if you do not fill the car?—A. Oh, yes; we can't get it at less than the minimum charge, no matter what we put in. If we only put in 20,000 pounds we must pay on 26,000. I will say something of the minimum a little later.

This refrigerator tariff which these car companies make and which the carriers enforce is graduated. The first rate covers Denver, Leadville, Ogden, Portland, Oregon, Pueblo, and Salt Lake—that is, a \$50 rate, and it then is increased up to the maximum of \$95, covering the New England territory. The territory we are in now takes the \$90 rate.

Q. (By Mr. KENNEDY.) Is not Salt Lake less than half the distance from Los Angeles that Portland is?—A. Portland is in the \$50 rate.

Q. Why should both be in the \$50 rate, Salt Lake being a less distance from Los Angeles?—A. The distance is about the same for transportation. You see from Sacramento it is about 700 miles to Portland and it is about the same distance to Salt Lake.

Q. Well, it is 300 miles at least farther to Pueblo. Pueblo is 300 miles farther away.—A. Yes; Pueblo is 500 miles farther, but they cover territory which they consider practically the same expense to them.

Q. (By Mr. LITCHMAN.) It is a sort of application of the zone system, is it?—A. Yes; they district the country. Both President Hayes and President Ripley have said to me within a few weeks that they considered the rate excessive and that steps would be taken to reduce it.

Q. (By Mr. KENNEDY.) Does that mean they are going to put on refrigerator of their own?—A. They did not say so, although that I believe to be the policy of the Santa Fe. They own now a good many hundred refrigerator cars. The Southern Pacific owns none, and the Southern Pacific is getting its equipment much cheaper than it could own it.

Q. (By Mr. LITCHMAN.) You have already said that these refrigerator car have not to any great extent been used for return freight. There is no objection to such use if the proper selection of freight is made, is there?—A. Not at all. They do use them. They use them as much as they can, and somebody in the Santa Fe operating department told me a few days ago—I think it was the general manager, perhaps, of that end of the line—that up to last year they carried I think he stated, less than 10 per cent of the cars west bound empty. They held them at various points for loads, and all the lines, Eastern connections, that bind their stuff westward by the Santa Fe have it hauled usually in those cars. The will transfer it out of other cars. In other words, if a car is delivered to the Santa Fe railroad at Kansas City, or by the Frisco at Burton, or by any line along its course, they will transfer out of whatever car the load is in into one of those refrigerator cars in order not to haul west bound empty.

Q. If the cars are used both ways does it enable the road to carry one way cheaper?—A. It certainly does, because they must pay the mileage on these cars up to a certain point, and they would have to pay mileage on the foreign car they hauled that. In other words, we will say the Missouri Pacific gives them a carload in its own car; they will have to pay the Missouri Pacific mileage to it from California, or at least to California, which they save in this other method.

Q. (By Mr. FARQUHAR.) Could you give the commission any idea how far this excessive freight enters into the cost of an article to the consumer, say, of a box of lemons from Los Angeles to New York City or Chicago?—A. The freight on a box of lemons is \$1.05, and the refrigeration would be 30 cents—exactly 30 cents to New York. There are 300 boxes of lemons in a car. Lemons are heavier than oranges, and the box is larger.

Q. What would a box sell at in New York?—A. California lemons bring about \$2.50 in New York.

Q. (By Mr. LITCHMAN.) How many lemons to the box?—A. Three hundred. Of course the number is variable; 300 is the number when the lemons are of the standard average size.

Q. A little less than 1 cent apiece wholesale?—A. A trifle less than a cent apiece. Of course later in the season they will bring a little more than a cent apiece.

Q. (By Mr. FARQUHAR.) What proportion of the selling price do the railroads get?—A. The freight and refrigeration are \$1.35 a box, and if a box sells at \$2.70 they get half of it and we get the other half, less the cost of packing. I think it is safe to say that the carriers get at present, approximately, half the gross proceeds of California fruit sales of citrus fruits.

Q. (By Mr. LITCHMAN.) Is there any disposition manifest on the part of the railroads to apply as a tariff all the traffic will bear?—A. They have never shown any other disposition in the California business so far as I am aware.

Q. (By Mr. FARQUHAR.) Are you able to lay your fruit down in the New York market as cheaply as the Florida fruit growers can?—A. By no means.

Q. How is it with Mediterranean fruits?—A. The Mediterranean fruits stand now about on a par with us, because they have to pay about 70 cents a box duty, and 30 cents freight, which makes a dollar a box on their lemons as against our \$1.05, unrefrigerated. If we refrigerate of course there is just that much differential against us. There is about 5 cents differential against us, and 30 cents more is added if we refrigerate.

Q. (By Mr. LITCHMAN.) Is there any preference as to the quality of the Mediterranean fruit as compared with California fruit?—A. That is a question that we are trying to settle on certain comparative tests. Of course we claim that our California lemons are better than theirs; they dispute that. The California lemon has this advantage over the Mediterranean, that ours are mostly seedless; theirs have a great many seeds. One chemical test was made recently and was decidedly in our favor. We made a shipment to New York at the request of the Italian chamber of commerce just before I left my office for a comparative test. The Italian chamber of commerce requested it, and we sent by express 4 boxes of selected lemons for the purpose.

Q. Which has the thickest skin?—A. Theirs have rather the thicker skin, because they do not cure their lemons; we sweat ours down after taking them from the trees; the Italian lemons are taken from the trees and shipped immediately I am told.

Q. Which is the larger size?—A. I should say that ours will run on an average larger than theirs. We aim, however, to get all our lemons three-hundreds and three-hundred and sixties. It is seldom they get larger and we seldom ship them smaller. The Italian lemons are many of them shipped much smaller than the three-hundred size; what I mean is 300 to the box, the standard size.

Q. Do you mean by sweating down the process of ripening?—A. It is not the process of ripening, but of curing. We take lemons from the trees as soon as they are a proper size. Where the grower is up to date, he sends his picker into the orchards with a ring in his hand to test the lemons. He is required to apply the ring every little while to see that he is keeping under the size. As soon as the lemons get that size they are removed from the trees, and if course if the market is strong they are shipped soon; if the market is weak, they are held. We are now holding a good many hundred cars of lemons in our packing houses in California, many of which were clipped in November and December. They are put into a cool dry place; they are handled carefully, and laid into the box and covered over; usually the box is lined with old newspapers or something of that sort, and the lemons are carefully laid in and the boxes set on top of each other in a cool dry place. Any sort of a building that is cool and dry will answer, and they are kept there until there is a market. If there is a market in 2 weeks they are shipped in 2 weeks; if there is a market in 4 months they are shipped in 4 months, assorted, of course, and then wrapped and the bad ones thrown out. The lemons that were put in in November and December are now extremely thin skinned, very fine, very full of juice. The only difficulty with them is the difficulty in transportation; they are very tender and very ripe, the highest grade of lemons obtainable.

Q. (By Mr. PHILLIPS.) Does the time of picking make any difference in the acidity of the lemon?—A. It makes but little difference as to the quantity of acid, unless the weather gets too cold. If the weather gets very cold, although the effect may not show in the texture of the fruit, it does to a certain extent affect the lemon, but the best of lemons we have at present are the November and December goods, because we had some pretty cold weather after that.

Q. The weather being cold, if they grew beyond the size of which you speak and became ripe would they be better?—A. No; they are not so good; they are not so desirable for market; the skin is thicker, and the tendency is to pithiness and puffiness. The ripe lemon from the tree is not desirable. We never let lemons get yellow; we never let them get that color on the tree.

Q. (By Mr. KENNEDY.) You spoke of lemons picked last November still being in your storehouse. I should like to ask you how account is kept with the fruit grower, for instance, who may have sent you last November 1,000 boxes of lemons, his lemons not yet being marketed? When does he get his returns?—A. He gets his returns when they are sold. If he has no storehouse of his own he may take his boxes to the common storage house of his association; they are his boxes and they are stacked up and marked as his boxes. When the time comes to pack those out they are graded and culls thrown out.

Q. Does he do that or do you?—A. The packing house does that and charges it to him. After the culls are thrown out the remainder are weighed up and he gets credit for them, and he gets his proportion of the whole pool. For instance, most of our associations have what they denominate a Christmas pool of oranges, or a monthly pool of oranges or lemons, although some associations pool for the whole season. That is a matter of local regulation among the members of that association as to whether they will pool for the season or pool periodically. If it is a monthly pool the manager of that association will send out notice to the growers who are members of the association. I am speaking of local associations, not our organization.

Q. (By Mr. KENNEDY.) Subordinate to you?—A. Subordinate to us. He will send out notice to bring 10 per cent of his crop, or 15 per cent of his crop, as the case may be. That is brought into the packing house and a ticket is issued for it. The fruit is culled and graded as to whether it is fancy or choice or standard, and he gets credit for that amount. All the fruit of that month's pool being marketed, the money is distributed pro rata among the growers who had fruit in that pool, if it be for the season or if there be several pools during the season, so that the man gets the credit for his fruit after it is culled and graded.

Q. Is everybody in this association treated so absolutely fairly that there are no complaints ever of favoritism or discrimination?—A. I would not like to say there are never complaints, but they are few. It is frequently the case that the foreman of the association is a disinterested party; not always so. Sometimes he is a grower himself; but the system is built upon the theory that every man is treated absolutely alike. Every man gets the opportunity to go into every pool and get the advantage of all markets at all seasons on a level basis. They may agree among themselves as to separate pools, and they may even agree that each man's fruit shall be handled for his separate account, if they desire to do so, but that is a matter of their mutual agreement. If a man is dissatisfied with the method in his association, he can file his complaint and have it investigated, or at the end of the season he can go to another association if he desires. But we have very little complaint of that kind.

Q. (By Mr. KENNEDY.) Would you have any advantage in shipping to the Atlantic seaboard if there were an isthmian canal; could you ship oranges that way?—A. Yes.

Q. And at cheaper rates?—A. We certainly could.

Q. Can you say what the sentiment of the fruit growers in California is with respect to the isthmian canal?—A. Unanimously in favor of the canal, so far as I know.

Q. (By Mr. PHILLIPS.) What would be the difference in time coming in that way as compared with the route by rail?—A. The Hydrographic Office of the Navy Department has given out the figures that a steamer would go from San Diego, our nearby port in southern California, to New York in 10 days and to Liverpool in 14 days. That is less time than we are now making by rail.

Q. (By Mr. KENNEDY.) The cost of refrigeration on a vessel would be considerably less than it is now?—A. I should say much less, much less.

Q. So it would make a great difference to you and to the consumer in the eastern part of the United States?—A. It certainly would.

Q. (By Mr. A. L. HARRIS.) Under the present arrangement, where the Southern Pacific Railroad has more than one line, have you any control over the line

that your cars pass over?—A. None whatever, except that the initial carriers take into their own hands the routing of our business to destination, and they give it out to their connections to suit themselves with only this liberty granted us, that they will give us any given terminal which we may request. They forward from one point to another. We can divert our shipments in transit; that is, we can have them forwarded at the original rate. We can ship a car to Kansas City, divert it to Chicago, divert it to Buffalo, divert it to Boston, the same rate applying to Boston that applied to Kansas City, and they will give us the terminal we request usually at any of those points.

Q. You spoke of having a case before the Interstate Commerce Commission. You say you treat that under the head of remedial legislation. Can you state that case now?—A. Yes. The case was a complaint against both the initial carriers for discrimination in favor of one shipper over others, this one shipper having under his ownership and control a line of refrigerator cars not only for his own benefit, but into which we were forced to put our shipments, and therefore our shipments were made under the notice and to a certain extent the surveillance of our competitor in business. We also complained of the refrigerator rates, I think. We made a general complaint of the tariffs themselves. We also denied the right of the carriers having published tariffs—through tariffs—to take the routing of the business into their own hands. Those are the main points of our case now pending for decision.

Q. How long has it been pending?—A. The briefs were submitted, the last ones, I think, in October. We complained of the whole private car system, our contention being that the carriers had no right to farm out the business to other corporations or individuals; that it was their duty to furnish us equipment, proper cars, and enough of them under their own control and not subject to any other individuals or corporations. We believe that the refrigerator rate is excessive because of this combination. Formerly, as I think I stated this morning, we were able always to get some reduction from the rates; whether it affected the freight rate or the refrigeration rate alone, it was usually made with the car line, and prior to the time when the initial carriers reached an agreement for the division of the business between themselves and for its division between the refrigerator car lines, shippers were able to make a special contract with the refrigerator companies for a reduced refrigerator rate usually of anywhere from \$10 to \$20 or \$25 per car. After this agreement was entered into between the initial carriers and the car lines, that opportunity was cut off and the rates, both the freight tariffs and the refrigerator tariffs, have been firm and arbitrary. We also complained to the Interstate Commerce Commission of the increase of the minimum carload weight. In earlier years the minimum carload rate for citrus fruits was 20,000 pounds. It was then increased to 21,000, then to 24,000, and more recently to 26,000 pounds. It has worked a hardship to the shippers, because many of the cars were unsuitable for carrying so heavy a load and caused a great deal of loss by decay, and for the further reason that many Western markets that would take a small carload could not take a larger one, and it limited our markets to a certain extent. In other words, it converted a wholesale market into a retail and jobbing market, and made it necessary for certain small towns to get their supplies through other cities secondhand, instead of getting them direct in car lots. Of course they were obliged to sell them at higher prices, and that limited the consumption and demand.

Q. (By Mr. A. L. HARRIS.) Before you pass to remedial legislation, if there is any subject that you have omitted, we should be pleased to have you take it up.—A. I think I may say before passing that we consider the existing freight rate too high. It was perhaps not too high in the earlier history of the orange business in California, as the prices were high then and the product comparatively limited. Now our citrus fruits reach about 25,000 carloads and are steadily increasing, and we must and do sell them much cheaper. Consequently the margin between the selling price and the freight tariffs is rapidly diminishing, and we believe that to-day the freight rate is excessive, considering the conditions.

Q. (By Mr. PHILLIPS.) About what percentage of the fruit is sold on the Pacific slope above the orange belt, for instance?—A. About 5 per cent of it, I should say. Another 5 per cent is sold probably in what we call the mountain territory. What we call the Missouri River points take about 18 per cent; Chicago and other Mississippi River territory about 17 per cent; trunk line territory, such as Cincinnati, Pittsburg, Cleveland, Buffalo, and that country about 15 per cent; Buffalo and east about 38 per cent, and the balance is scattered through the South. I have not the exact figures.

Q. (By Mr. A. L. HARRIS.) What are the freight rates to Mississippi River points?—A. \$1.25 a hundred after passing mountain points, Denver, Pueblo, Trini-

dad, Cheyenne, Salt Lake, and Montana points; those points \$1.12½ a hundred; all points east of that \$1.25 a hundred everywhere.

Q. Everywhere?—A. Yes; postage-stamp rate.

Q. (By Mr. LITCHMAN.) Would you prefer to have substituted for that postage-stamp rate, as you express it, a mileage rate?—A. That is a very hard problem. We have given that a great deal of consideration, and there are about as many reasons on one side of it as the other, although I suspect that it will come to a graduated rate. I am inclined to think it will come to that. It is of considerable advantage to us as it now stands. If we controlled all of the product, in other words, if the whole product were under one control for distribution, I think I should prefer a graduated rate. Then we would put into the cheaper territory of the West and Northwest the cheaper class of fruit and put it where it would stay and avoid the necessities of continual forwarding to other markets. There are a great many points, however, involved in that question.

Q. (By Mr. A. L. HARRIS.) Have you any remedial legislation to suggest?—A. Yes. First, I think the powers of the Interstate Commerce Commission should be enlarged. I think it should have power to determine what are reasonable rates and to classify the rates. I am speaking now more on this last phase of it, particularly with reference to all of our Pacific coast interests. It is quite well known, of course, that where the carriers are forbidden to increase the rate without the consent of the Interstate Commerce Commission, they accomplish the same result by changing the classification. It is my understanding that the pending bill, known as the Cullom bill, gives the commission authority for the determination of what is a reasonable rate and also power to classify and to enforce their orders.

Q. Would you have the order go into effect at once, subject to the right of appeal?—A. I would.

Q. (By Mr. FARQUHAR.) How can a body like the present Interstate Commerce Commission find out and know what a reasonable rate is?—A. I was about to say that on the question as to whether the commission itself should be changed or enlarged, I do not know that I care to say anything. I assume that Congress, perhaps, would find a way to make the commission what it ought to be to obtain the necessary information. I simply mean that there ought to be a tribunal of that kind that would pass upon these questions. I do not think, however, that it is so extremely difficult to ascertain what is a reasonable rate. The carriers claim that their combination is necessary—the combination among themselves into what they call a community of interest—is necessary in order to maintain rates, and it seems to me that the admission that carriers have found it practicable to reduce the rate is at least some evidence that they can stand a lower rate. I concede that the fact that a freight rate is cut is not always proof that it was too high; but the fact that carriers are willing to take the business year in and year out at a lower rate is certainly *prima facie* evidence that the rate is high. When that state of things exists, it seems to me it is not very difficult for the Interstate Commerce Commission or some commission properly constituted to inquire into it and compare rates, one part of the country with another, one class of freights with another, water competition, and all those factors. To us on the Pacific coast it hardly seems reasonable for the carriers to say that in competition with water rates they can haul goods from New York or Chicago to the Pacific coast for 50 cents a hundred, but can not afford to haul the products of California out for less than \$1.25 up to \$1.60 a hundred. If the water competition makes the business unprofitable, it would seem reasonable that they would let it go to the water; and the margin is so wide that there seems small opportunity for an argument as to whether all the rates are equitable.

Q. (By Mr. FARQUHAR.) Is it not a fact that your transcontinental freight or mountain freight is really twice the cost that it is on the prairie roads of the West in hauling?—A. I should think so; very likely.

Q. And is not that one of the greatest reasons for high rates?—A. I think that is one of the reasons.

Q. The immense cost of road, equipment, maintenance, and the light trains they are able to haul?—A. Yes; I think that is a fact; we concede that it is; but we do not admit that one class of freight in competition with the ocean traffic should be hauled at 50 cents a hundred and another class that has no water competition should be charged \$1.50 a hundred. Again, the bulk of our traffic is free from a large proportion of the expenses connected with transportation. If we compare the rates per ton per mile over the country, we will find that a very large percentage of the cost of operating is in the handling of the freight itself. Now, the carrier never handles our freight at any time. He never puts it into the car and never takes it out; so that when he is figuring on the freight rate per

ton per mile, he is including every class of freight on short hauls as well as long hauls, small lots as well as car lots, and there is there a great difference.

Q. Have you any idea how many it takes in an ordinary railroad of a thousand or twelve hundred miles in the department alone of freight, the freight office proper itself, in taking care of the changes of rates, making the pro rate and other rates in connection with through bills, and everything of that kind?—A. No.

Q. How much of a clerical force it needs?—A. I know it requires a large clerical force; I know that.

Q. Taking all the railroads of this country, how many would be employed in the Interstate Commerce Commission in making up the rates?—A. The bulk of that clerical service is not in making up rates, but in the correcting of billing and making out of expense bills themselves, and not in rates. I think you will find that almost every large carrier, large railroad, has comparatively few men who have to do with the making of rate sheets, tariffs; in other words, very few men that have to do with making tariffs. There is a large number of men who have to do with the collection of the charges and with making up the bills and records and accounts and keeping accounts with other roads; but that has not to do with the rate making itself. It does not enter into the question of the making of the rate to any point.

Q. Do you think any body of 5, 7, 9, 11, or 13 men sitting in Washington could take up a reasonable rate and know the reasons for the reasonable rate when they did not know the conditions of the roads at all in the country?—A. I would not undertake to say that a body sitting in Washington could take up all these questions at one time and settle the whole question of freight rates all over the United States.

Q. For instance, suppose you had any trouble in California and you had to wait 1 year or 2 years to get it rectified by a body sitting in Washington; how would your business stand? Wouldn't you rather trust the railroads than the commission?—A. We have to trust the railroads now and we think they have made an unreasonable rate. We think there ought to be some tribunal to review that rate. There are 2 railroad companies operating in California. They have agreed to divide the traffic between themselves. I know they will probably deny that statement. It is true, nevertheless. I feel perfectly safe in saying that it is without, unless I am asked, giving my reasons for believing that.

Mr. PHILLIPS. Do you desire to hear the reasons?

Mr. FARQUHAR. I do not know as we do.

The WITNESS. I do not care to go into the reason unless it is asked for, and then I will; I have no objection to it at all.

Q. (By Mr. KENNEDY.) It seems to me that Major Farquhar's questions to you are on the supposition or assumption that you would have the Interstate Commerce Commission make all the rates. I would like to know whether that is your idea, or that they should pass upon rates which are said to be unreasonable, sitting as a court to judge them?—A. That is exactly what I mean; that I would have them have power, as I said in my first answer, I think, to determine what are reasonable rates.

Mr. FARQUHAR. That is right.

The WITNESS. I assume that the rates would be determined on hearing. In California we would complain of the rate and would state our side of the case, and I would have the Interstate Commerce Commission have power to pass upon the case and say who was right. As it is to-day nobody has any power except the carriers, who agree among themselves. They have eliminated the competitive features of the traffic. There is no competition whatever, the carriers agreeing between themselves, and we are powerless. I say, therefore, that I would have the Interstate Commerce Commission, or some proper tribunal, investigate the facts, look at our statement and at the carriers' statement, and say whether the rate was reasonable. If it is, we must submit until the court has reviewed the finding of the commission, if there should be any power of review.

Q. (By Mr. A. L. HARRIS.) I would like for you to give the reasons for believing there is an understanding between the railroads?—A. The reasons are that in entering into these contracts with the refrigerator lines the 2 initial carriers make contracts for precisely the same amount of equipment, and they have kept it precisely the same on both lines ever since. They have refused repeatedly to permit fruit to be loaded on one line and forwarded on the other line, because the line over which the shipper desired the fruit to be forwarded was already ahead in the shipments. They have repeatedly asked the shippers to even up the shipments between them. They have refused to allow fruit to be hauled from the vicinity of one road and loaded on the other line and shipped out. They have insisted under circumstances of that kind upon billing the car out over the road near whose line the fruit

was grown, and stated that it was unfair to their competitor to permit the grower to haul his fruit over to the other railroad. These are the reasons that I give why I say they have agreed on a division of the traffic. I hardly think they will seriously deny that they have.

Q. Have you any complaint to make in regard to the delay of getting a final hearing under the present law and organization of the Interstate Commerce Commission?—A. We think, of course, that it is extremely slow, but what the circumstances are that lead to that delay we do not undertake to say. There is probably too much business for the commission in its present form, although I do not know about that. I have no specific complaint to make.

Q. If a case is taken to the court, do you know anything about delay there?—A. I know it takes a good while to get a hearing and determination.

Q. Do the conditions sometimes change before the hearing is had?—A. Yes; I have known cases in which the causes for complaint had been removed before the decision was rendered.

Q. A vast amount of expense and time had been used substantially to no purpose?—A. I do not undertake to say that what has been done is to no purpose. The commission have remedied a number of our complaints, simply because the complaint was filed. They forced the party who was in the double capacity both of shipper and car-line operator out of business as a result of our complaint to the Interstate Commerce Commission. No doubt about that.

Q. (By Mr. LITCHMAN.) Have they really done it or merely done it on the surface?—A. So far as appearances go, they have actually done it. I believe they have in this instance. I think the party is out of the business.

Q. (By Mr. A. L. HARRIS.) The Interstate Commerce Commission is then of some benefit?—A. I think it is, most decidedly. I think its powers should be enlarged.

Q. And with its powers enlarged, it would be of benefit to the shipper?—A. Most decidedly.

Q. (By Mr. FARQUHAR.) How would you enlarge its powers, as an economic body or a judicial body?—A. I have stated I would give it authority which it does not now possess, to pass on the reasonableness of tariffs where a showing is made, I do not undertake to say I would empower the Interstate Commerce Commission to make tariffs, but to say whether they are reasonable on a proper showing.

Q. What is the difference between a declaration on the part of the commission as to the reasonableness or unreasonableness of a tariff and making the tariff itself? What is the difference? If they have judicial power to declare a tariff unreasonable and to name a reasonable rate, what is the difference between that and having the power to make tariffs?—A. There is no difference as to that particular tariff. Still, it does not follow that they make tariffs because they are to pass upon the reasonableness of a tariff after it is called in question. One of the strongest points upon which the carriers argue the reasonableness of their tariffs is that under the present tariffs covering the Pacific coast traffic, they are scarcely able to pay their dividends. Nobody, I think, would object to the payment of their dividends on anything that ever went into the construction of the railroads, but what we object to is the attempt to pay dividends on enormous amounts of bonds and stocks for which nothing was ever done.

Q. (By Mr. LITCHMAN.) Do I understand that you believe the establishment of this power would have a deterring effect upon the railroads in the fixing of their rates primarily?—A. Most decidedly. If they knew there was some authority that could review these tariffs and investigate them, I have no doubt that knowledge would have a salutary effect in the fixing of the tariffs themselves.

Q. How do the tariffs of the present time compare with those of 10 years ago?—A. Our tariff is exactly the same as when the traffic was in its beginning, and certainly the cost of operating is not so great as it was then, because the traffic of every kind has increased along the line.

Q. Does that statement apply generally to other traffic as well as to the fruit?—A. I think it applies generally to the Pacific coast traffic, except such as is under the influence of water competition. The bulk of our products are fruit, for which we need rail transportation. The cereals of course go by water to Liverpool, and they are not affected.

Q. (By Mr. FARQUHAR.) When you speak of water transportation, do you mean transportation via the Isthmus or around the Horn?—A. Both.

Q. What is the difference between the water rate that you can get around by the Gulf and the Isthmus to New York or Liverpool and the charge of the Southern roads?—A. I am not able to say because I am not personally interested in any traffic that is in competition with the water transportation.

Q. Do not the same parties own the Pacific Mail Company's line that own the Southern Pacific?—A. Yes. A considerable portion of the freight shipments to

California have water competition and come there at half the rate we pay on our fruits. There are some commodities that are carried to California at 50 cents per hundred, and I think there have been rates even lower than that.

Q. (By Mr. LITCHMAN.) You are speaking now of water transportation?—A. No; by rail in competition with water rates, in competition with the clipper ships.

Q. (By Mr. A. L. HARRIS.) You can not at the present time enjoy that benefit on account of your fruit not keeping for a sufficient length of time?—A. No; we can not use that transportation for our business because the time is too long. If we had the isthmian canal we could send our citrus fruits and our dried fruits, nuts, and all sort of thing to market by water, or by rail in competition at the water rate.

Q. (By Mr. LITCHMAN.) How large a proportion of your fruit products are exported to foreign countries?—A. A comparatively small portion except canned fruits. There is a good deal of dried fruit; just how much I am not prepared to say. Of the green fruits and citrus fruits but a small quantity goes abroad. We are increasing the shipments of oranges to Liverpool and London, and will continue to do that. So far it is comparatively small business.

Q. (By Mr. A. L. HARRIS.) Have you anything to say in regard to national quarantine along the line of the Wadsworth bill?—A. Yes. We are distinctly in favor of the Wadsworth bill as it stands. It is my understanding that it failed because the nurserymen of the East objected to the provision in the third section which subjects trees, plants, nursery stock, etc., to the quarantine laws of the State to which the shipment is made.

Q. (By Mr. FARQUHAR.) Please give the number of the bill and the House in which it originated?—A. It is House bill 96, Fifty-sixth Congress, first session. The nurserymen objected to the provision that after the nursery stock had an inspection at the point of shipment it should be subjected to another inspection at the point of destination. We were given to understand that the bill probably could be passed if we were willing to consent to strike out that provision, which we were not willing to do. We very much need a quarantine bill on the Pacific coast, particularly against importations; not so much against interstate business as against the importations from abroad, particularly from Mexico. Mexico is liable to have its orange orchards destroyed by what is known as the orange worm, the Morales maggot, which infests the oranges of Mexico in nearly all districts.

Q. (By Mr. PHILLIPS.) It works on the orange itself?—A. It burrows in the orange and lives there. I have seen as high as 15 in one orange. We have none of them in California, and very much desire a quarantine against it. We also desire a quarantine for our deciduous fruits against all infections of every kind.

Q. (By Mr. LITCHMAN.) Have you investigated and ascertained if there is any legal objection to the quarantine established by the State itself?—A. We have a vigorous quarantine law and apply it. Our apprehension was that if the Wadsworth bill should pass with that clause stricken out, shipments could be forced into the State without further inspection. I believe the lawyers consider there is more or less question on that point, but we were anxious to be safe.

Q. Do you mean the young trees?—A. Yes; all sorts of bulbs and nursery stock, young trees, and everything of that kind. Our idea is that if they are grown in Florida or Louisiana or Iowa or any other State, and it is sought to ship them into California, they should be subject to inspection at destination.

Q. (By Mr. A. L. HARRIS.) What have you to say in regard to the protective tariff for your country?—A. We think the existing duties should not be reduced either by legislation or treaty.

Q. (By Mr. LITCHMAN.) Reciprocity treaties you mean?—A. Yes.

Q. (By Mr. FARQUHAR.) Of the reciprocity treaties which do you find the most oppressive to you?—A. The Jamaica and French treaties both would work a hardship, to our fruit interest particularly.

Q. Does the French reciprocity treaty give California any advantages at all?—A. Yes; there is an advantage on several items, on its wines, olives, raisins, prunes, walnuts, and almonds.

Q. (By Mr. A. L. HARRIS.) Do I understand it is for or against you?—A. As the duty stands it is in our favor; the modification was to reduce the duty, and would militate against us. We therefore object to the reduction of the duties either by legislation or the ratification of the reciprocity treaties which have been prepared.

Q. (By Mr. FARQUHAR.) If the French treaty was ratified would it work to the advantage or disadvantage of California generally?—A. To the disadvantage. We do not see any form in which it would be to our advantage.

Q. Is there anything in the French treaty particularly to the advantage of the United States that the people of California in any shape desire, in silk goods or

whatever else?—A. I can not say as to what the modifications are on silk goods. We very much prefer to have to pay the price for the silk and let the fruit grower get the price for his products. If he can not get anything for his products he can not wear silk, and he doesn't have to.

Q. (By Mr. A. L. HARRIS.) Do you favor the preservation of our forests?—A. We do, most decidedly. The preservation of our forests on the Pacific slope and particularly in California, because that is not so much true in the north where they do but little irrigating, and in certain portions of which they have too much water, is of vital importance. The destruction of our forests destroys the water storage. We have found by the most careful investigation, measurements of water, etc., that under the same rainfall where our forests have been burned away or otherwise removed the water for irrigation is greatly reduced. It not only has that effect but it reduces the rainfall itself. We believe that the forest reservations should be transferred from the Interior to the Agricultural Department, where they will have proper attention. We do not question the motives of the Interior Department, but we do say the Agricultural Department is in touch with our interests and has shown itself to be interested and in full accord with our undertakings. And we have no doubt if the forest reservations were transferred to the Agricultural Department we would have a very much better patrol system, and a system that would actually protect the forests. As it is now the patrol system amounts to very little.

Q. Has there been any scientific tests made as to the conservation of moisture by the continuation of our forests?—A. There have been repeated tests of that character made, and I am told by most competent engineers that there is no question whatever about the decrease in our rainfall where the forests have been removed. Take southern California, for instance, where irrigation is so important and where the forests are so necessary, we find this: Our rainfall comes of course, as it does everywhere, from the contact of the counter currents. The clouds move up from the sea against the mountains and comes in contact with the cold moist air arising from the forests, and immediately rain is precipitated. The very same mountains, after the forests or even the undergrowth is burned away, are practically rainless. The fogs and clouds come up from the sea, but there is no moisture in the earth—no undergrowth that holds the moisture and sends it back to form a cold current—and the clouds simply dissipate or pass over. That phenomenon has been witnessed and carefully investigated to show beyond any reasonable question that the preservation of our forests is absolutely indispensable to the perpetuity of our irrigation systems in that region.

Q. You spoke of having a wet season and a dry season in California which is detrimental to the growth of corn. I think you did not state whether or not it is advantageous to the growth of wheat.—A. Yes. The rains usually begin in November, sometimes even earlier, but in central and northern California, where they grow cereals, the rainfall usually puts the ground in condition for seeding by November, and the sowing continues to midwinter. The rains continue at intervals through to April. Once in a while we have a little rain even later than that date, but we expect very little after April, if at all. That puts the wheat ready for harvest by the 1st of June. There is no subsequent rain, and the wheat cures on the stalk and is harvested from June on to September. The harvesting there is all done with one machine at one time, the wheat curing on the stalk. Those winter rains, of course, are absolutely necessary to the growth of the cereals. We raise a good deal of barley also. Our food for work animals is largely barley hay. In some sections alfalfa is grown, but that is more particularly for stock feeding—for cattle.

Q. Will alfalfa do well?—A. Very well, when there is enough water. Alfalfa must be irrigated in order to produce repeated crops. It will not produce more than two or three crops in a year without irrigation. With irrigation it will produce a crop every 30 days.

Q. How many tons of hay per acre will it produce in the course of a year?—A. Good, well-watered alfalfa will produce $1\frac{1}{2}$ to $2\frac{1}{2}$ tons at a cutting, and it can be cut from 7 to 9 times during the season. Of course it is not cut in the winter because it would not make hay then.

Q. (By Mr. KENNEDY.) Speaking of remedial legislation, you would recognize a law of Congress which should provide for the construction of an isthmian canal as remedial legislation in the interests of your industry?—A. We certainly would.

Q. (By Mr. FARQUHAR.) Do you think it would be worth while for the American people to undertake the building of a canal at an expense of more than \$100,000,000, and have no American tonnage pass through it? Ought we to build a canal for the world and have no tonnage of our own?—A. I suppose that abstract question would be solved by whether you charge enough to make it pay. I believe

we need the canal. Whatever other people may desire in the premises, I believe the interests of the Pacific coast, not to say anything about our acquisitions, justify the building of the canal.

Q. Even if the amount of our tonnage engaged in the deep sea trade of the world is about 11 per cent?—A. I can not undertake to say how soon it will be more than 11 per cent.

Q. (By Mr. PHILLIPS.) Is it not a fact that all shipyards are busy now building?—A. I believe they are.

Mr. FARQUHAR. Building fighting ships?

The WITNESS. I believe they are, but if the Government was justified in the first instance in appropriating, as I believe it did, about 26,000,000 of acres of land for the construction of the Central Pacific Railroad, and a great many more millions for other transcontinental lines, I believe it is equally justified in further developing the Pacific coast by, among other things, the construction of the canal.

Q. (By Mr. FARQUHAR.) Yes; but it is American tonnage and American traffic that go over our transcontinental lines, but the Nicaragua Canal would carry 80 per cent foreign tonnage.—A. Possibly so.

Mr. PHILLIPS. Is that testimony?

Mr. FARQUHAR. I asked the question to bring out a comparison in the matter of the land grants to the roads, and the money to be spent in building the canal.—A. I do not know. I think that a very large percentage of the tonnage through that canal would be American tonnage.

Q. (By Mr. KENNEDY.) Coastwise?—A. Yes; although I am not prepared to say what percentage of the whole tonnage that would pass would be American.

Q. (By Mr. PHILLIPS.) All coastwise tonnage would have to be American?—A. Yes.

Q. (By Mr. KENNEDY.) Regardless of what kind of bottoms, foreign or American, that the fruit might go in, in the event of the construction of the isthmian canal, the fact is, as you say, I believe, that the people of the East would get the fruit at a very much less price than they do now?—A. I think they would. I not only believe that our California products could be sold to the consumer, most of whom are Americans, at less price, but I believe our other industries of the Pacific coast would be largely benefited and developed.

(Testimony closed at 4.15 p. m.)

WASHINGTON, D. C., June 12, 1901.

TESTIMONY OF MR. THOMAS TURNBULL,

San Francisco, Cal.

The commission met at 10 a. m. At 2.04 p. m., Mr. Farquhar presiding, Mr. Thomas Turnbull, No. 1403 Montgomery street, San Francisco, Cal., appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. A. L. HARRIS.) Mr. Turnbull, you may state your name, your residence, and your occupation.—A. My name is Thomas Turnbull; I reside in San Francisco, Cal., and I am engaged in the real estate business.

Q. What is your address in San Francisco?—A. No. 1403 Montgomery street, San Francisco.

Q. How long have you resided in California?—A. About 12 years.

Q. Have you been connected at any time with the agricultural industry of the State?—A. Yes.

Q. How long have you been connected with that industry?—A. Four or 5 years—I have been farming about that length of time.

Q. How long has it been since you left the farm?—A. About 6 years.

Q. Have you any interest in agriculture at the present time?—A. Indirectly only.

Q. How long have you been in the real estate business?—A. About 12 years.

Q. Are you authorized by the board of trade to represent the different industries of the Pacific slope before this commission?—A. I was selected by a committee of the State board of trade to represent the State of California before this commission. I have here their commission, if you care to have it read.

(Reading:)

“SAN FRANCISCO, CAL., September 12, 1899.

“The undersigned committee of the State board of trade, appointed to recommend to the Congressional Industrial Commission a witness from this State to represent its industrial needs and conditions, does hereby designate and commission as such

witness Mr. Thomas Turnbull, and request that he be called to appear before the Industrial Commission.

"GEORGE C. PERKINS.

"JOHN P. IRISH.

"N. P. CHIPMAN.

"W. H. MILLS."

Q. Have you a prepared statement, Mr. Turnbull?—A. I have a brief statement.

Q. You may proceed in your own way to make that statement as to the industrial conditions on the Pacific slope.

The witness read as follows:

"INTRODUCTION.

"Renewed interest in our State has been awakened by the momentous events of the past 2 years, which have given to California and to her metropolis special and unusual importance. The prediction has been made by some of the wisest and most far-seeing observers in this country of the movements of population and commerce, that San Francisco is destined to become a great commercial emporium and is to be to the western part of this continent what New York City is to the eastern part; that a large population will center here to engage in the new and rapidly growing commerce which must enter or pass out of the Golden Gate; that a greatly enlarged and more profitable market must necessarily be created for the varied products of our State by reason of our new relations with countries of the Orient; that the completion of the isthmian canal will remove many obstacles hitherto standing in the pathway of our progress, and that the Pacific coast will rapidly become the home of many millions of people. California is already feeling the impulse of the great change taking place in the commerce in the Pacific Ocean. I have undertaken in the present report to briefly outline the attractions which our State offers to the home seeker, the capitalist, the tiller of the soil, the manufacturer, the miner, the lumberman, in short, to all who wish to engage in this new and promising field of enterprise.

"I shall not attempt to conceal an intense affection for the State of my adoption, but I wish to assure your honorable commission that this partiality shall not tinge the facts which I present; they, at least, shall have the foundation of absolute truth. The love of Californians for their State, which is proverbial, is not devoid of justification. What other country presents such inspiration of love and devotion? In what other country is there broader freedom of thought and action? In what other country are the alluring prophecies which attend young life more certain of fulfillment? In what other country do the higher blessings of peace and plenty minister to the comforts of age? Are there other countries in which honest industry achieves higher respect, or in which labor earns a higher meed of profit and honor?

"Looking backward we see a history founded in the romance of adventure. In the present we are laying the foundations of a noble commonwealth by the establishment of permanent industries. If, therefore, the manifestation of love for our State may sometimes appear boastful or provincial, let it find apology in the consideration that provincialism is an expression of local patriotism, and that with the people of California it is the inspiration of high endeavor, which, when duly chastened, will ripen for our beloved State its growing harvest of hope.

"LABOR IN CALIFORNIA.

"The great advantages enjoyed by the laborer in a newly settled community, especially in the line of high wages, are seldom lasting. They were probably greater and of longer duration in California than in any other part of the Union, enduring in large measure until after 1870. This is partly due to the absence of railroad connection with the East before 1860. There are still not a few lines of industry, particularly those requiring considerable skill, and in which all the work must be done on the spot, that offer the worker better rewards than he could obtain in the same trades in the Eastern States. The explanation of these high wages and the general prosperity of the laborer in such a 'new country' during the first few years after settlement is of course a simple one. These advantages have been frequently discussed by economists, and are continually used to illustrate various theories of wages, of interest, or of rent. The explanation is found in the fact that in such newly and thinly settled communities the first settlers enjoy, with less restrictions than elsewhere, the assistance of nature in their labor. The mere 'labor of appropriation' is in such cases slight compared with the product obtained thereby. Land and nature's other resources are abundant and obtainable at comparatively little cost. The reward obtained by their use is very large. The same fact also explains, in part, the uncommonly large returns that capital obtains in such

places. So long as there is still untilled land at the disposal of the State, or for sale at a reasonably low price, there is no question that wages in that vicinity must be as high as the returns which that labor could obtain if applied to the cultivation of land. For California, of course, the explanation is incomplete, unless we include also the effect of the possibilities in mining. So long as there were many unclaimed placer mines easily available the rate of wages in other lines of industry had to be, naturally, high enough to offset the advantages to be found there.

"The explanation of the causes which so rapidly reduce the wages of labor in these same communities to a level which, although not altogether so low as that in other longer settled communities, is yet so low that the differences are no longer very important, is not so generally understood. For California there are a number of explanations of this change which are advanced, sometimes singly and sometimes together. Sometimes we are told that the explanation is to be found in the fact that the land has all been withdrawn from the market or is held at speculative prices so high in proportion to its real value that its purchase would confer no greater advantage than a similar purchase would in an older community. There is some force in this explanation. Yet it does not seem to me to apply in like degree to all the different kinds of labor in this State. Nor is it yet true of California that most of the lands and natural aids to production are held at prices which would prevent the thrifty settler from realizing great advantages from their use. Another suggestion, and one that grows directly out of the foregoing and, in a measure, presupposes its acceptance, is that which maintains that many would-be settlers of small fortune have flocked here under the mistaken impression that there are still lands to be had on terms commensurate within their moderate means. Finding themselves disappointed in these hopes, these persons have gathered in the cities, and there, by competition in the few lines open to them, have forced down the wages hitherto received. This explanation, which was the one favored by Mr. Meriwether, the special agent of the United States Labor Bureau, who made an investigation into certain labor problems here in 1887, seems plausible enough. There are some facts that seem to warrant it. It presupposes, however, what we have just seen was not quite true, namely, that land and other natural advantages are no longer to be had on reasonable terms. There has been from time to time a temporary accumulation of immigrants in the cities who, from lack of means, found themselves unable to realize the extravagant hopes which they had entertained. But they have never been sufficiently numerous to have any permanent effect on wages, and generally soon found the way of at least partially realizing their ends.

"Another and still more popular theory is that which finds the whole explanation of the lowness of wages in California in the competition of the Chinese and Japanese. That the presence and possible increase in numbers of a class of laborers willing to take certain kinds of labor at any price and unable through ignorance of our laws, etc., to acquire much advantage from the possession of land, and not, like the rest of the population, looking and hoping for influence, but more than content with a low wage, would seriously affect the wages of all labor of the same grade and possibly reflect unfavorably on the wages of other grades of labor, is undeniable. But there remains the stubborn fact, preventing us from attributing this purely to race characteristics, that, whenever one of these hated Chinese or Japanese succeeds in acquiring skill, as, for instance, in the case of the Chinese cooks, his labor commands a price so high that he at least can not be said to depress wages. It is the incompetence of the unskilled Chinese that is the chief cause of the low wages they receive. Here, as well as elsewhere, wages depend upon the value of the product. The increased output of the product of unskilled labor at a decreased cost, the cost being estimated in terms of a lower standard of life, causes a fall in the value of the product and necessarily a fall in wages. But, as usually applied, the argument from the presence of the Chinese is made to explain too much. The reasons for the change in the conditions, even of unskilled labor in California, to one closely conforming to that in the East, are not summed up in this one. Had the Chinese not come, a similar fall in the wages of unskilled labor, though possibly not quite so great a one, would have taken place. The presence of the Chinese only aggravated and intensified the effect of forces already at work.

"The chief error of all these explanations arises from the attempt to find a single cause for a phenomenon that is complicated in its nature. We must examine the conditions of different classes of labor separately.

"The first class to be considered consists of those skilled laborers producing goods for a market broader than the State of California. The extraordinary distances to be traversed in bringing these goods to market has its greatest effect here. Such industries can only live when the natural advantages enjoyed by producers equal or exceed the advantages enjoyed by the other members of the competing

group, plus the excess cost of transportation. And California wages in these lines can only exceed wages in the same line elsewhere by just as much as the natural advantages, less the increased cost of transportation are greater. As these natural advantages are more and more appropriated, they lose their influence on wages. As soon as it is no longer possible for the laborer to be an independent producer, if the wage offered him is not sufficient, and thus obtain a larger return, lower wages will have to be accepted by those who choose this line of work. That is, the wage-earner can no longer receive rent as well as wages. The chief constituent element of this group is the body of skilled labor engaged in the production and preparation of fruit and wine. The wages of such laborers are as a rule still higher than those of the same grade elsewhere. Here, too, belong the miners, but for these, of course, the cost of transportation is no hindrance, and they receive correspondingly higher wages still. Here belonged formerly the wheat raisers of the State. But as Mr. Horace Davis has so ably shown, wheat raising in this State is no longer a profitable industry, for reasons peculiar to that industry, and so exceptional as to justify us in omitting further consideration of it here.

"The second important group that we will consider is composed of those industries which compose goods competing in the local market, directly with goods that can be imported from outside the State. It is easy to see that in all of these lines of industry the only absolute advantage that the laborer has in California is measured by the cost of transportation. There is a slight advantage arising from the fact that the nearness to the market enables the producer here to gauge more accurately the demand as to kind, quality, and amount than the more distant producer. And again, if the commodity is one in the manufacture of which a large amount of the raw product can be drawn from this State, there is another slight advantage accruing from that source. These two latter advantages, however, do not, so far as my observation goes, more than offset the higher rate of interest on the capital employed, and consequently the laborer can obtain little from that source. So that, in the main, the difference in the rate of wages in favor of California in these lines of industry can not be greater than the cost of transportation. As soon as the needs of the community call these industries into existence the rate of wages will be in close conformity to the rate in the East. And this I have ascertained to be the fact. This group of industries stands at one extreme. In them wages never were high; they were mostly late in coming into existence, and only rise into importance where the weight or bulk of the goods is so considerable as to increase the cost of transportation.

"At the other extreme stands a group composed of those industries requiring skilled labor and in which the whole of the labor must be rendered on the spot. These, as we should naturally expect, came early and partook in the highest degree of the natural advantages which the new country afforded. There wages are to-day higher than in the first group. The first report of the bureau of labor statistics of the State contains some figures which appear to show that the wages earned in California in that year (1883-84) were very much higher than those in the same trades in New York and Chicago. The difference in the rates of wages quoted for these places is astonishingly great. A close inspection of the list, however, shows that it is composed almost entirely of trades of this third group, namely, trades which from the nature of the work done had to render all their services on the spot, and which as skilled labor would not be apt to feel directly the competition of the Chinese or of disappointed immigrants. The list contains bricklayers, masons, carpenters and joiners, gasfitters, painters, plumbers, slaters, blacksmiths, bakers, shoemakers, cabinetmakers, coopers, printers, tinsmiths, and brassfounders. As will be seen, the list contains those industries that have all the advantage which location here can afford, and was well calculated to deceive. It was probably not chosen with any intention to deceive, being composed of those industries which had been longest established, and these would naturally be of this favored class. Only one or two of the industries belonging to the other class are included in the report, and they were so because they were already becoming important. They are the tailors, the coppersmiths, and the cutlers, and all of these, as might be expected, show none of the peculiar advantages as to high wages which the others enjoyed. It is in this third class that the effect of the two first causes of the three commonly alleged would be most plainly seen. But in this those theories are not sustained, since the higher wages still paid in these lines of work do not show the effect of the excessive competition that is claimed is the result of holding land at speculative prices. Although the wages of labor of this class still compare favorably with the best wages paid the same kind of labor elsewhere, yet there has been a decided fall since the report of the bureau of labor statistics above cited. This can be explained, of course, in the usual way by the movement of labor toward that class, a movement which during the last decade has had time to accomplish in part the inevitable equalizing.

"To this group belong the railroad employees. The report of the Interstate Commerce Commission for the year ending June 30, 1894, contains statistics of the wages of railroad employees all over the United States. These statistics are based upon averages of so large a number of persons, and covers so long a period as to be truly representative. It would be natural to suppose that on account of the greater "mobility" of railroad employees local advantages would have relatively the least effect upon their wages. But the careful statistics of the commission show that even this class of skilled labor partakes of the advantages of the favored locality because it must be rendered on the spot. According to this showing the wages of all employees, except those classed as general officers, were for 3 years, 1892, 1893, and 1894, higher in California than in any other part of the United States, and, in most cases, very much higher. We select for comparison the commissioners' Groups II, III, and X. Group II includes New York, New Jersey, Delaware, Maryland, and most of Pennsylvania; Group III includes Ohio, Indiana, and southern Michigan; Group X includes all the States and Territories west of the Rocky Mountains, which are sufficiently homogeneous to be representative of the conditions in California, particularly so in view of the fact that a large part of the railroad system is under one management. To these 3 we add the general averages for the whole country. Other groups might have been selected which would have shown more marked contrasts in favor of California, but in them the lower rates are due to exceptional circumstances. No such circumstances can be urged against the two Eastern groups selected.

"The following table presents a comparative summary of average daily compensation of railway employees for the years ending June 30, 1894, 1893, and 1892:

Class.	Average daily compensation in dollars.											
	United States.			Group X.			Group II.			Group III.		
	1894.	1893.	1892.	1894.	1893.	1892.	1894.	1893.	1892.	1894.	1893.	1892.
General officers.....	\$9.71	\$7.84	\$7.62	\$11.09	\$7.93	\$7.35	\$10.20	\$8.58	\$8.89	\$9.16	\$7.78	\$8.15

Unclassified.....		1.64	1.57			3.63		1.95	2.15			

"The figures presented in the table bear out the conclusions reached above. It is the highly skilled men that have the largest proportional advantage, while as the skill required for the different positions diminishes, the advantages enjoyed in the way of higher wages grow less. The only part of the country which shows anything at all approaching these advantages is the commissioners' Group VII, including the comparatively new country of Wyoming, Montana, Nebraska, and parts of the Dakotas and Colorado, where the conditions are similarly advantageous to energetic, skillful men. If the commission's report were continued for 1895, it would probably show that a large part of the advantages have been lost. The ill-advised strike and the depression have caused much rough adjusting and many heavy reductions and discharges.

"We come now to a fourth group of laborers, that is everywhere the most discouraging to study and everywhere the most poorly paid, viz, the unskilled. In newly settled communities this is the class of labor that first gains relatively most, from the cheapness of land and the favorable terms on which nature's bounties can be had, and which, on the other hand, first feels the movement toward a state of affairs more nearly in accord with conditions elsewhere. A fall in the wages of this kind of labor is to be expected when laborers of this class become in the

least excessive in proportion to the amount of land still available. Being in the highest degree inert, and never very competent, this class early becomes excessive, even though its numbers appear small. The suggestions commonly offered in explanation of the fall in wages apply here if anywhere. Here the competition of the Chinese is most keenly felt. There has certainly been at times a glut of this kind of labor. Mr. Meriwether seemed to think that this glut was only felt in the cities. He cites, as evidence of the absence of such a glut in the country, the fact that in rural districts the economical farmers take the children out of school in the season to pick fruit that would otherwise decay. But this does not support his contention. For since the children had to be supported anyway, and the labor in this case is light, a very slight earning would be ample recompense for their labor. The value of such fruits when picked is in many instances sufficient only to pay for the cheap labor, and would probably not pay at all for the dearer labor of adults. The correct explanation of the fall in the wages of unskilled labor in California is that there is no longer lines of industry which can give employment to unskilled labor with any greater advantages than elsewhere. Could unskilled labor produce here (as it did at first) a commodity, which, for special reasons had a high value in proportion to the amount of labor employed, wages would never have fallen in spite of the advent of the Chinese.

"To sum up: For the unskilled labor the rate of wages in California already conforms to the rate paid elsewhere: First, because the natural advantages which could be used by such labor are mostly monopolized; second, because a large part of the unskilled labor is peculiarly inefficient. A few lines of skilled labor employed in industries exploiting peculiar natural advantages still earn large wages. Many lines of skilled labor, of such a sort that the work is done on the spot, obtain slightly higher wages than prevail in the East, and will do so as long as the advantages enjoyed by the first class of skilled labor are not all appropriated. The rate of wages enjoyed by skilled labor producing commodities which compete in the California market with commodities manufactured outside are higher by part of the cost of transportation, and this will be the first class of skilled labor to lose the advantage which it enjoys.

In this connection the following tabular statement may be instructive:

Trade.	Nominal wages.	Actual.
House carpenter.....	\$3.50	\$2.90
Mill carpenter.....	3.00	2.50
Mill hand.....	2.50	1.50
Laborer (in mill).....	2.00	1.25
House painter.....	3.00	1.75
Machinist.....	3.50	3.00
Laborer (in machine shop).....	2.00	1.50
Iron molder.....	3.50	2.75
Blacksmith.....	3.00	2.40
Brass finisher.....	3.00	2.50
Tinsmith.....	3.00	2.75
Baker.....	1.60	.90
Compositor.....	3.00	2.00
Gripman (cable car).....	2.25	1.75
Conductor.....	2.50	2.00
Cooper.....	2.50	1.50
Upholsterer.....	2.50	1.75
Cabinetmaker.....	2.75	2.25
Tanner.....	2.50	2.00
Shoe cutter.....	3.00	2.40
Harness maker.....	2.50	2.00
Cigar maker.....	2.00	1.50
Bookbinder.....	2.50	1.75
Tailor.....	3.00	2.00
Shirt maker.....	1.15	.75
Laundryman.....	.75	.55
Saleswoman.....	1.50	1.25
Bag maker (jute).....	1.00	.80
Box maker.....	2.00	1.50
Laborer (miscellaneous, city).....	1.25
Farm laborer (with machines) ¹	1.75
Farm laborer (without machines) ¹75
Farm laborer (Chinese) ¹75
Fruit canneries (men) ¹	2.00
Fruit canneries (women) ¹	1.00

¹ Work intermittent, and often paid by the piece or job. The average per year is unmeaning.

DOMESTIC SERVANTS.

White cook.....	per month..	\$20.00 to \$30.00
White maid.....	do.....	15.00 to 25.00
Chinese cook.....	do.....	25.00 to 40.00

ORGANIZATION.

"That the laborers of California have felt in their turn the same need of organization that was felt in the other States is natural since the conditions of labor have become or are rapidly becoming the same here as elsewhere. The movement in the direction of organization did not make much ground until about 10 years ago—that is, about the time when the extraordinary advantages at first enjoyed had disappeared. There were, to be sure, a few trades unions before that time. The Hat Finishers' Union of San Francisco is said to date from 1853. There are six unions in San Francisco that were formed during the Kearney movement. Most of those before 1880, however, partook more of the character of social or political clubs than of trade organizations for strictly trade purposes. At first the movement spread slowly. Probably the fact that it was so generally discountenanced by the employers, between whom and the employees there existed frequently an unusual intimacy, and the general distrust of the public as well as the comparative weakness of the trades, had something to do with this slowness of growth. But the main reason was that wages were high and the conditions of labor extremely good. As the conditions changed, trades unions came in more rapidly. In the years 1884–1890 show the greatest increase in numbers and strength of these organizations. Although the increase since then has not been so rapid, the results of the period of formation have been quite permanent. This is rather surprising when we consider the rapidly changing character of the population of the State and of all its industries. Of course many of the older unions have passed away; many were not strong enough from the very beginning to hold their own, but those that have survived have grown generally stronger and more efficient, and the number that survived, together with the natural growth, is large enough to form a very appreciable factor in the development of industry and of the State's resources. Each important city in the State now has a large part of its various trades organized into local unions, most of which are affiliated with or are branches of associations running throughout the United States and Canada. These unions of different trades in the same city or county are then for the most part united in local federations, and these federations then send representatives or delegates to the recently organized coast convention, the first step in the direction of a still broader organization.

"It is not easy to ascertain the exact numerical strength of the unions. Partly because of the lack of any impartial investigations, partly because of the boastful misrepresentations of the unions' officers, and in other instances on account of the desire to conceal who are members, or how strong the union is. Nor would it be very instructive if we were able to ascertain the number of members accurately, because it is constantly and rapidly changing, as the conditions of labor change and as the different industries prosper or fail. Old unions die out and new ones take their place, which may in turn live or die within a year. Sometimes a great wave of excitement will swell the numbers rapidly. In 1888 the bureau of labor statistics estimated there were about 20,000 members of labor unions in the State. A conservative estimate places the members from 40,000 to 45,000. There are but few, if any, important industries that are not at present organized, and many organizations exist of the unskilled. Even the Chinese are organized into unions called 'Tongs,' but on account of the extreme secrecy trustworthy information concerning them is impossible to obtain.

"It is not necessary to give a full description of the organization and purposes of the unions in California, for they are, of course, practically the same as elsewhere. Some points in which they differ slightly, or which are necessary for comparison, have been selected. The dues that are imposed on the members are generally quite small. They differ too much to allow of any average being drawn. The initiation fees vary from 50 cents to \$10; the monthly dues from 10 cents to \$5, the bulk of these being below \$2. The members are reconciled to the payment of the dues and assessments in most cases by the fact that they thus form a fund out of which they are entitled to certain benefits. Both of them are for moderate amounts, owing to the smallness of the sums collected. The general principle in regard to the payment of assistance to the sick seems to be that the weekly payments shall be approximately one-half of the regular wage set by the union. The funeral benefits generally aim to secure a decent burial, but are in some cases a little more. They vary from \$50 to \$250. Some few of the unions provide also that a member who is out of work through no fault of his own shall receive stated assistance from the union. This dangerous loophole for drones is, however, not left in many of the constitutions, and is generally hedged around with various safeguards. The amount of 'strike pay' is generally smaller than that to be paid in cases of sickness.

"The federations that unite the unions in each city or county vary in their form

from a loose confederation, with no power to enforce any legislation over the unions of which it is composed, to a strong body, to which all important questions are referred. Many important functions are performed by these bodies. Their offices and quarters often serve as the center for the unions, and sometimes they own or rent the rooms where the meetings of the unions are held. The officers of the federations sometimes relieve the officers of the unions of a part of their more formal and clerical duties. The office of the federation, which is generally open all the time and centrally located, serves as a general means of communication between the different unions and sometimes as an intelligence office for those out of work. The rules of most of the federations do not allow the unions of which they are composed to declare a strike without the consent of the council of the federation. A local union therefore that desires to strike has first to convince the other unions of the justice of its intention and obtain the sanction and indorsement of the federation, and then in most cases also submit the matter, with the approval of the federation, to the central authority of the association of which it is a branch. There have been many instances where the necessity of thus showing the reasons for a strike has, together with the conciliatory attitude of the officers of the federation, prevented serious trouble.

"The organization of the Pacific Coast Council of Trades and Labor Federations" is extremely simple. There is little more than is necessary for parliamentary action. This association is as yet very weak. It is supposed to meet once a year and to be composed of delegates from all the unions on the coast. But the expense of sending delegates to meetings of the national trade organizations, which are held for the most part in the East, is so great that the unions hesitate to incur the additional expense of sending men to this convention also. Its aim is to care for those interests of the unions that are peculiar to the whole of the Pacific coast, such as the regulation of the hours of labor by law and the like. That a need of such an organization should be felt is a mark of the economic isolation of the States lying west of the Rocky Mountains.

"The aims and purposes of the unions, and the methods by which they hope to achieve them, are practically the same as those of trades unions everywhere, and can not be considered here. In the matter of making formal preparations for the adjustment of disputes between the employer and the workmen there is nothing to be noted that is peculiar to California. As in all the other States, there is a growing tendency among the unions to provide either in their own constitutions or in some other way, as for example, in their federations, for a board or a committee of arbitration. Practically this board is nothing more than the spokesman of the unions in cases of dispute. The State board of arbitration is almost useless, because it can not move until it is called upon by the parties to the dispute, which rarely happens. There is in San Francisco a strong branch of the Socialists Labor Party. It carries on a continual but moderate agitation, and sometimes influences the unions in their policy. Like all similar organizations in this country, the unions have been the favorite field in which the advocates of infallible nostrums for the cure of all the diseases of the body politic have sought a market for their wares. These persons have from time to time gained the ears of the workingmen, and from time to time the unions have seemed to give their indorsement to some of these measures. Sometimes a newspaper run in the interest of some of these hobbies or of some political party has been chosen as the organ of the unions. Sometimes one has proclaimed itself such without the direct sanction of the unions. Sometimes the unions have given their sanction, because the paper then formed a convenient medium for the circulation of their notices. But it is seldom that these papers really represent the thinking of the members of the union. These members are for the most part sober-thinking, conservative men, who are little likely to believe that all the ills of society can be cured by one dose of any political medicine. Many of them, too, are property owners. The constitutions of many of the unions contain clauses which forbid the discussion of any political or religious view at their meetings, a prohibition which, I am told, from many reliable sources, is pretty generally enforced. Whatever views the members may hold, the unions as such do not often enter politics. The organized trades have not always been happy in the choice of their leaders. They have here, as elsewhere, too often abused the powers which they possess, and have been more arbitrary than any employer, but these excrescences are apparently passing away.

"The importance of the movement that introduced trades unions into California can not be well over-estimated. Not only do the results already attained warrant this statement, but the possibilities that are inherent in them both for good and evil are enormous. In the first place, the establishment of unions has brought the California workmen into touch with the movement of labor elsewhere. Whether this has been by actual affiliation in organization or not there is as a

result the closest affiliation in thought. This adds materially to the forces that tend to break down the economic isolation of the State. That too close an affiliation with the Eastern unions in the case of those which, as I have shown, enjoy peculiar advantages from being located here, is at the cost of the California union, is clear. The Western workmen have in these industries an advantage which is likely to make them the heaviest contributors to any cause calling for financial support. On the other hand it is clear that if the unions are strong enough they may retain for California, for a longer period than would otherwise be possible, the peculiar advantages of a new community. But in the main the unions have had little power to retard the gradual change in the conditions which we studied in the first part of this paper."

Now, as to the condition of the workmen, the deposits in the savings banks will show to some extent in the paper that I am reading now.

Q. (By Mr. KENNEDY.) Now, you are passing from the labor question to something that does not peculiarly relate to labor.

MR. LITCHMAN. He is taking that up to show the prosperity of the labor people.

THE WITNESS. I am showing the prosperity of the labor people now as compared with years ago.

(Reading:)

"During the year 1892 there was deposited in the savings banks of California the sum of \$95,546,196.03; during the same period there was withdrawn from the same banks the sum of \$83,304,726.35, there thus being deposited \$12,241,469.68 more than was withdrawn."

Q. (By Mr. FARQUHAR.) You say \$95,000,000?—A. No; I say \$95,546.13, the net deposits of the workmen then. I think it should be \$95,000,000.

"During the same period there was withdrawn from the same banks the sum of \$83,304,726.35, there thus being deposited \$12,241,469.68 more than was withdrawn. That is a gain. During the year 1894 there was deposited in the said banks \$97,496,712.51, and there was withdrawn \$104,155,474.06, or \$7,658,761.55 in excess of the amount deposited."

Q. Some of your local unions carried that?—A. Yes.

(Reading:)

"In 1894, or rather during the year 1894, there was deposited in the said banks \$97,496,712.51, and there was withdrawn \$104,155,474.06, or \$7,658,761.55 in excess of the amount deposited.

"In 1899 there was deposited in the said banks \$77,572,588.06, and withdrawn \$71,867,176.16; there being thus deposited, in excess of the amount withdrawn, \$5,705,411.90.

"The savings banks of a State or of a nation are the workers' depositories, and by the rise and fall of deposits therein the workers' comparative prosperity can be measured as by a barometer."

Q. (By Mr. KENNEDY.) Is that the end of the labor feature?—A. Well, yes, partly.

Q. You say, speaking of the Socialistic Labor party that, "Like all similar organizations in this country, the unions have been the favorite field in which the advocates of infallible nostrums for the cure of all the diseases of the body politic have sought a market for their wares." I should like to ask you if the workmen afford any more a favored field for the sellers of those nostrums than the farmers or any other class of people?—A. I think in California they are rather more so because of the fact that they are not quite so well educated as the farmers. I think that they are more susceptible to the teachings of such leaders than are the farmers. That would be my impression.

Q. Where do the nostrums of the Populist party find the greatest support, among the workmen or among the farmers?—A. That I am not able to say. I think, however, they get some support from both parties, both organizations.

Q. You think that it is applicable to one class of people any more than another, that the workmen are any more susceptible to the wiles of these people who have these peculiar nostrums to peddle than anybody else?—A. I do not know as I could hardly charge them with that, but then we sometimes think that is the case.

Q. You do not come here as a representative of the workmen or labor organizations, do you?—A. No; I do not.

Q. And you are not therefore able to speak for them?—A. No; I could not very well speak for them in that respect.

Q. You say the chief cause of the cheapness of Japanese or Chinese labor is its incompetence?—A. Yes; the unskilled.

Q. You said its incompetence. I should like to ask you if the fact that the Chinese can live very much more cheaply than the American workmen can is

also a factor in accounting for the cheapness of Chinese labor?—A. I think so; yes.

Q. Is it a greater or less factor than that of incompetence?—A. I think it is rather a greater factor. A Chinaman can learn very readily if he has the opportunity. He is brighter than the Japanese as a general thing, as far as learning is concerned and in adapting himself.

Q. (By Mr. LITCHMAN.) Have you ever visited the shoe factory in Chinatown in San Francisco?—A. I have been through it, but not to give it any special attention.

Q. Is it not true that the workmen there use the same improved machinery as the large factories of the East?—A. Yes; I presume so.

Q. Are not the superintendents men educated in the shoe factories of the Eastern States?—A. I have no doubt they are, but I am not aware of that fact.

Q. Is it not a fact that they turn out just as good a shoe for the grade of shoe made in that shoe factory as they do in any shoe factory in America?—A. I have no reason to doubt that fact.

Q. How does that fact coincide with your suggestion that the Chinaman is incompetent?—A. Oh, I spoke of the unskilled Chinaman. The skilled Chinaman is just as bright as any man.

Q. (By Mr. KENNEDY.) Is the sentiment of Californians generally in favor of continuing the restriction of Chinese immigration?—A. I would say so, as a general thing.

Q. Without regard to party?—A. Yes; both parties indorse that principle, I think.

Q. What is the cause of this sentiment among Californians?—A. The Chinese are undesirable.

Q. Are they desirable as citizens in any way?—A. We do not consider them as such.

Q. Would the people of California treat them as social equals?—A. I think not.

Q. Would they under any circumstances treat them as social equals, do you suppose?—A. I think not—under present conditions at least.

Q. Do they ever adapt themselves to the customs in this country?—A. They do not seem to do so. They seem to wear their own dress—that is, the dress peculiar to their country—and they do not assimilate or associate particularly with the other classes of people with us.

Q. Will they ever, in your opinion, conform to the political institutions of our civilization?—A. In my opinion, not.

Q. Then, in view of those facts would you say that they are desirable citizens or that it is desirable to have them come to this country?—A. No; I would not.

Q. For any purpose?—A. I would say to exclude them as far as possible, and I will add this fact, that the 35,000 Chinamen give the police of San Francisco more trouble than all the remainder of the city put together. They cost the city more because they are gamblers—they are noted for that—and for that reason and a great many other reasons that might be stated they are a very undesirable class of people.

Q. You know, I suppose, that the Chinese exclusion act will terminate on the 1st of May, 1902?—A. I understand so; yes.

Q. Is the sentiment of California in favor of extending that law?—A. Yes.

Q. Is the sentiment overwhelmingly in favor of it?—A. I think so. I think it is very generally so. I think that any man that came up for office would have to advocate that extension to be elected on any ticket, either the Republican or Democratic ticket. He would have to take that stand or he would be defeated.

Q. (By Mr. FARQUHAR.) In discussing this Chinese labor feature in your paper, there were two reasons given for the small wage of unskilled labor and that was, as I take it, the scarcity of that class of labor in the State and the inefficiency of the Chinese part of the labor. Now, are both these reasons good for the small wage that you have among unskilled labor, scarcity and the inefficiency of the Chinese?—A. While labor was scarce, a white man would command larger wages than a Chinaman, even if labor was scarce.

Q. He does at any time?—A. Yes; he does at any time. It would make a difference of from 50 cents to 75 cents a day on the same class of labor. For that reason I think the Chinaman would receive smaller wages always.

The witness then concluded the reading of his paper, as follows:

"The story of a national calamity is told in the showing above, that in the space of 2 years the tide of the worker's condition had changed to an extent that decreased his earnings in this State almost \$20,000,000. An excess of withdrawals over deposits speaks eloquently of employment lost and not regained during long months of idleness and waiting for better things. Fortunately, we can say that the reverse is the condition now.

"In connection with this whole subject of the condition of the labor of the State now, as compared with 4 or 5 years ago, and in regard to the benefit which labor receives from the generally better condition of industries of every description, it is not uncommon to hear the questions: 'Granting that conditions generally are more prosperous, is the individual worker better off? Does he receive more pay? Is the wage rate per diem increased?' To all of which we reply:

"The condition from 1894 to 1896 left an enormous percentage of the wage-earners without employment of any kind. Of those who had employment some few escaped reduction of pay. In cases where direct reduction was not made, it was made indirectly in the way of working less than full time. When the tide turned the first result was not of course increase in pay, but absorption of the vast amount of idle labor, and working on full time once more. The next effect was increase in pay in isolated cases, and from that to more frequent cases, until, at this time, demands on the part of labor for more pay and fewer hours of work per day are heard in all directions, with the pleasure of hearing in addition, in most cases, that the demands are granted.

"In concluding this article, one more phase of the subject of the present condition of labor in this State should have attention, especially in connection with what has just been said, and that is in relation to increase in cost to him of the necessities of life, coincident with the increase in prosperity generally as spoken of.

"It may be said in general, that the cost of groceries in this State now averages in price about the same as in 1896; some being a little cheaper and some a little dearer.

"Hardware, stoves, and house-furnishing goods are about 15 per cent higher than in 1896.

"Meats are about 10 per cent higher.

"Drugs and medicines are from 5 to 10 per cent higher.

"Clothing is about 10 per cent higher.

"Dry goods are from 5 to 10 per cent higher.

"Fuel: Coal is the same as in 1896; wood is from 15 to 20 per cent higher.

"Rents: As to houses usually occupied by wage-earners, the same, or from 5 to 10 per cent lower. Newer and better classes of houses are some little higher.

"From all of the foregoing it would seem that the contention that the condition of the wage-earner in California compares well with the condition of the wage-earner in any other place that can be named, is well sustained, and that in fact California, in this respect, leads the States of the United States, and the United States in turn leads the countries of the world."

Q. (By Mr. FARQUHAR.) You have stated in your paper about this scarcity of unskilled labor and also the inefficiency or incompetency of the Chinese labor. Is not that latter statement the one that really explains your small wages?—A. It is just possible.

Q. Is it natural in California that there should be more money in wages to unskilled people than the product itself could afford?—A. No, I think not.

Q. Now is it not a general complaint in California that white labor will not accept employment in unskilled lines?—A. To a certain extent that is true.

Q. Is it not a pretty general condition in your State?—A. I would say so.

Q. But is it not a fact that the two features of the cheapness of this Chinese labor actually shuts out the unskilled labor of other nations?—A. Yes; I think that is true to a certain extent.

Q. And provided there is a sufficiency of the Chinese labor, there is no opportunity for the unskilled labor of other nations or of Americans?—A. No.

Q. Is the presence of the Chinese as a laborer, a misfortune to the body of the people and to the welfare of your State, or is there any benefit in this cheap labor?—A. They produce as a class very little. They assist in manual labor and some well-paid labor. Chinese cooks are in a pretty good demand and they command good wages. But the unskilled Chinaman is very undesirable.

Q. How does he expend his earnings?—A. I do not know, but it is charged they gamble among themselves. I do not know how they live, but they are not a desirable people at all.

Q. Out of their earnings, there is not much returned to the body politic?—A. I do not think so.

Q. Do they hoard and send money to China, or spend it in gambling among their own people and make rich their own gamblers?—A. I understand they send a large portion back to China, and of course they spend a certain part among themselves, what part I could not say.

Q. Can you give the commission any idea of the average time a Chinaman spends in California before he returns?—A. I haven't the information at hand.

Q. Could you give us an idea of the proportion of Chinese that earn this money in America and take it to China with them, out of the something like 35,000 in San Francisco?—A. I should say in an offhand way that they remain about 15 years in California and then go back home. Some might stay longer and some not so long, but an average of something near that time.

Q. (By Mr. A. L. HARRIS.) In what industry is the Chinese labor found mostly?—A. It is diversified; the skilled labor is employed among different trades—tailors and shoemakers and different kinds of manufacturing establishments which they have in a small way; of course the unskilled do any work they can get.

Q. Is there any Chinese labor found on the farms?—A. Yes; a considerable portion of it in fruit picking time and in the sugar-beet industry.

Q. Are the Chinese valued as farm laborers generally?—A. They are quite steady. They are there Monday morning, and a good many white men are not so punctual. They stick close to their work.

Q. Are they preferred to the white men on that account?—A. In some degree in some classes of work it might be they are, but not in a general way.

Q. Is that preference on account of the cheap labor or on account of their ability?—A. I think it is on account of the cheapness of their wages.

Q. Do they work on the railroads as section hands or in the construction of railroads?—A. Yes.

Q. Are they considered valuable in that respect?—A. I do not know how valuable they are, but I guess they work right along.

Q. Is the number increasing?—A. Not very rapidly. I think the exclusion act keeps them from coming in very rapidly.

Q. Where do they get in now and how?—A. I am not able to state. They are smuggled in if they get in at all, except the merchants that are entitled to come in. They have no trouble in landing in San Francisco; but as to those not entitled to come, I do not know where they get in.

Q. Do they increase by birth?—A. Yes; to a limited extent.

Q. Are there many of them females?—A. There are quite a number females.

Q. Are they married?—A. I think a great number of the females are held in slavery, as we call it, for prostitution.

Q. Slavery?—A. We call it slavery.

Q. In what way?—A. A man brings a Chinese woman to San Francisco and he sells her, may be for \$2,000. She is kept in a house of prostitution, and the man who buys her gets all that she earns.

Q. Does he hire her out?—A. Yes; the authorities have been trying to suppress this for the last year or so.

Q. Is this sale an open sale?—A. I do not know how open it is, but that transaction has repeatedly occurred.

Q. Has proper effort been made to suppress it?—A. Yes; the United States Government authorities took hold of it about 3 months ago and are making a desperate effort now to close it up.

Q. How long has that practice been in vogue?—A. For the last 10 years at least.

Q. Is it not very demoralizing?—A. Certainly; it could not be otherwise.

Q. Have you laws sufficient to meet it?—A. The law has been avoided in many ways, but the United States authorities took hold of the evil about 3 months ago and we think now it will be suppressed.

Q. Are the most of the females that come to this country in that condition?—A. I should say quite a number. I could not say what proportion, but I should judge nearly half.

Q. Are they still coming in that way?—A. They are coming as far as they can. The exclusion act prevents them to some extent.

Q. If the exclusion act is rigidly enforced, what opportunities have they to come?—A. They come in this way: A merchant is entitled to bring his wife. He often brings one of these people over as his wife and then sells her for gain. They do a great many things not proper to do.

Q. (By Mr. FARQUHAR.) Have the Six Companies anything to do with the importation of these prostitutes?—A. I could not say they have. I do not think personally they have.

Q. Have any officers connected with the Six Companies anything to do with it?—A. They may have. It certainly is a well-known fact in San Francisco that there are numbers of these Chinese prostitutes and this prostitution is openly carried on.

Q. (By Mr. A. L. HARRIS.) What is the social condition in Chinatown in San Francisco?—A. It would not be worth speaking of. Morally, it is very bad; it could not be worse. It is almost dangerous to go through there in the daytime unless you are well armed or have a policeman with you. It is not safe.

Q. (By Mr. KENNEDY.) Have you any knowledge of Chinese spending any of their earnings in this country except for the bare cost of living and clothing themselves?—A. That is about all they spend, that which they need, and very little of that. They live so very cheaply that the white men can not compete with them at all in the matter of labor. It is said one of them can live on 10 cents a day; I do not know how true it is.

Q. Is their presence degrading to our civilization on the Pacific coast?—A. I would consider it so.

Q. (By Mr. A. L. HARRIS.) Then, if the Chinese exclusion act is not extended, the white labor of the Pacific coast will come in competition at once with this Chinese labor?—A. Yes; with the labor of about 600,000,000 of them. We would be in a very bad shape indeed.

Q. Would that condition of affairs be to the industrial interest of California?—A. I think that would be against the industrial interests as well as the other interests of the State.

Q. You may now take up your next subject.—A. It will be the sugar beet.
(Reading:)

"SUGAR BEET.

"The beet-sugar industry is one of the most important branches of our agriculture and promises great development. It is claimed that experience and scientific experiments, as well as the natural climatic influences existing here, attest the superior merits of our State for sugar-beet growing. Briefly summarized, the advantages are: Earlier maturity of the beet; earlier opening of the campaign; long season for harvesting; long run of the factory; greater yield per acre; greater per cent of saccharine; immunity from frost and immunity from rain at critical periods. Sugar-beet growing is of such present and future importance as to justify placing before you the following statement from the American Beet Sugar Company, of Oxnard, Cal., which shows the growth of the industry in the State:

Beet-sugar products, 1888-1899.

[Tons of 2,000 pounds.]

1888.....	1,910	1894.....	18,615
1889.....	2,457	1895.....	23,827
1890.....	3,351	1896.....	31,815
1891.....	3,074	1897.....	35,290
1892.....	6,887	1898.....	18,086
1893.....	9,888	1899.....	32,445

NOTE.—The output for 1899 should have exceeded any previous year, but it was cut down by drought where facilities for irrigation had not been provided. The yield hereafter will show a marked increase.

"The tests for the percentage of sugar are made at the factory for each load or from each car as delivered, and the farmers at Oxnard are allowed to employ a check chemist to verify these tests. The company furnishes the seed at 12 cents per pound, which is cost, and the amount is deducted from the first delivery of beets.

"The company has in its employ a number of agricultural experts, and advertises to give the growers the benefit of their knowledge as to the proper handling of their lands, planting, thinning, harvesting, etc.

"An average crop on good land is from 12 to 15 tons per acre. Many growers, of course, obtain very much higher results than this. The average cost to raise an acre of beets, including seed and when all the work is hired done, is \$20 to \$25, delivered on board the cars or at the factory. Should the grower do all or part of the work, this amount is correspondingly reduced.

"Experience has shown that it is advisable to plant one-fourth to one-third of the land to beets every year, rotating with whatever other crops are best adapted to the soil. Crops grown after beets have the advantage of the beet plowing and thorough cultivation necessary for successful beet growing, and it is the common experience that larger yields are obtained from other crops when rotated with beets.

"Some of the benefits derived from beet farming.—Beet farming is not only beneficial to the land in increasing the depth and physical condition of the soil on which the crops are grown, thus enlarging their yield, but also the beet tops and pulp furnish a valuable feed for sheep and cattle. A yield of 15 tons of beets leaves on the field 6 to 8 tons of green tops, and for the same 15 tons of beets delivered at the factory the company will give 7½ tons of pulp, as the company gives to the grower one-half the weight of his beets in pulp at 10 cents per ton, when taken on

board cars at the factory or when hauled away by teams from the factory loading chute. One acre of beets, therefore, yields to the grower from 6 to 7½ tons of pulp, at a cost of from 60 to 75 cents per acre if taken at the factory, in addition to the returns received from the beets delivered to the factory and the beet tops which he retains.

"The following table shows the value of different feeds compared with beet tops and pulp:

Feeding stuff.	Value per ton.	Value per acre.
Alfalfa hay	\$8.00	\$48.00
Barley straw	5.00	9.00
Barley grain	15.00	18.75
Barley hay	9.00	18.00
Beet pulp	1.85	10.12
Beet tops	2.59	15.54

"Therefore, 15 tons of beets will bring to the grower \$15.54 worth of tops and \$10.12 worth of pulp per acre, less \$1.75, price of pulp at factory, an increase of over 40 per cent on the beet crop, figuring 1 ton of beets at \$4, which can be taken as a low average price. It is remarkable how stock will improve on these two products from beets, which, up to the present time, have been a loss to the growers.

"The beet tops are best utilized by bringing cattle or sheep upon the beet fields as soon as the beets have been carted away. Especially sheep will do surprisingly well on beet tops and fatten quickly. The droppings of the animals remaining on the land will contain almost all the mineral plant food of the tops, so that it is, for the fertility of the land, the same, whether the tops or the droppings are plowed under."

Q. (By Mr. A. L. HARRIS.) How many factories have you in California?—A. We have 8.

Q. What amount of money is invested in your factories?—A. Something over \$10,000,000 in the 8 plants.

Q. Can they manufacture sugar in competition with Hawaiian sugar?—A. I think so.

Q. There is no uneasiness, then, on the part of your California producers on account of the competition of Hawaii?—A. There does not seem to be. The greatest uneasiness we have is to get a good crop. Some years we are short of water and do not get a good crop.

Q. Is the industry increasing in magnitude?—A. Yes; 10 years ago we had only 2 factories.

Q. Are they in competition one with another?—A. Not that I know of. There is no particular competition between them. They all seem to want to make as much sugar as possible.

Q. Is there a combine between the factories, that you know of?—A. Not that I know of.

Q. Do they use American or German machinery?—A. Part of it is made here and part is imported. I think Mr. Spreckels imported a part of his machinery, but just what part I am unable to say.

Q. Is his one of the older mills?—A. Yes. That is, one of the largest, Claus Spreckels's.

Q. Is the output refined and ready for market?—A. Yes.

Q. (By Mr. FARQUHAR.) What is the commercial grading of the sugar produced from the beet?—A. I think it ranks about the same as the cane sugar. I think they give 1 pound more of the beet sugar for a dollar than they do of the cane.

Q. Is that in the case of the granulated or loaf sugar?—A. The granulated.

Q. Is there much difference between the cane and the beet sugar in color and attractiveness?—A. The two look very much alike; they are very similar in point of appearance and quality.

Q. Is most of the beet sugar used in canning and other processes of that kind?—A. A large portion of it is, and quite an amount of it is shipped out of the State into other States. It is consumed in the market in San Francisco to a considerable extent. I presume a great deal of it is used in canning also.

Q. Are the parties in interest in Hawaii and California practically the same men?—A. Some parties in California are interested in Hawaii. There may be others interested there that are not interested here.

Q. Are there independent establishments in California that have nothing to do with the Hawaiian product?—A. I think there are.

Q. Is it a product itself that any farmer can engage in that buys the seed from the association and plants it and brings his product to the factory? Is the business open to all?—A. It is open to everyone; no restrictions.

Q. (By Mr. A. L. HARRIS.) Are your beets rich in saccharine matter?—A. Yes; I think they are the richest beets in the country.

Q. (By Mr. TOMPKINS.) What is the least sum of money required to build a sugar factory?—A. I think it would be something like a half million dollars.

Q. You have 8 factories and \$10,000,000 invested. That would indicate an average of more than \$1,000,000?—A. Yes.

Q. And you had 2 of those 10 years ago?—A. Yes.

Q. And you produced about 3,000 tons of beets 10 years ago?—A. Yes.

Q. Then you had over \$2,000,000 invested at that time to handle 3,000 tons of beets?—A. Yes.

Q. Is it possible to operate profitably with so large a capital and so small a quantity of raw material?—A. I do not know how it was at that time, because I came to California about 13 years ago, and I did not understand the conditions then as well as I do now; but I presume the plants just starting in, with new machinery and everything, would have a greater expense than later on.

Q. Even at the present time you make about 35,000 or 36,000 tons of beets do you not?—A. I think so.

Q. That would be in the neighborhood of 4,000 tons for each mill?—A. Yes; in 1899 we had 32,000 tons.

Q. How much sugar does a ton of beets make?—A. I do not know exactly. It varies according to the percentage of saccharine matter. The beets run from 12 to 14 per cent sugar.

Q. (By Mr. FARQUHAR.) You may proceed with your next subject.—A. The next subject will be commerce, manufactures, and shipbuilding.

(Reading:)

“COMMERCE, MANUFACTURES, AND SHIPBUILDING, SAN FRANCISCO.

“Our commerce, manufactures, with some exceptions, and our shipbuilding center at and around the city of San Francisco, the leading commercial emporium of the Pacific coast. The scope of this report does not admit of details as to the manufacturing industries of the State. There is much more done in this direction than is generally supposed, for the list of manufactures embraces many important articles and the value reaches a large sum. Still, California can hardly yet be classed as a manufacturing State. The conditions, however, are in many respects most favorable, and with the increasing trade of the Orient and the enlargement of population manufactures must attend the great change that is about to take place.

“We have already attested our capacity for and adaptability to the important industry of shipbuilding. All the raw materials are found on this coast to meet the expanding demand for ships built in the waters where they are to operate. There is every logical reason for assuming that around the bay of San Francisco the future will witness shipyards employing many thousands of workmen. The Union Iron Works is an establishment known throughout the world for its splendid examples of shipbuilding it has turned out. Iron ships built in this climate of little temperature variation need no readjustment; witness the splendid performance of the battle ship *Oregon*.

“But it is to the increasing commerce of the Pacific we must look for State growth and development commensurate with our high expectations. The subject has seemed to justify some statistics illustrating the present condition of the commerce of this coast. The tables which are hereto appended were prepared by Hon. E. W. Maslin, deputy naval officer at this port, and are compiled from Government records. (See exhibits.)

“The first table shows the imports into and the exports from Pacific ports for a period of 10 years to and from all countries. It shows that while our imports have increased in the period only \$2,800,000 our exports have increased over \$38,700,000.

“The next table is designed to show in detail the imports from and the exports to Asia and Oceania, the countries with which we now have new and important relations. The statistics are for 5 year periods. Our imports from countries of Oceania have fallen off about \$3,000,000 and the exports have increased about \$3,000,000. Our imports from countries of Asia have increased over \$3,700,000 and our exports have increased about \$13,000,000. For the whole period our imports have exceeded our exports by about \$12,000,000.

"The table showing the relative importance of Pacific coast ports for the fiscal year ending June 30, 1898, will be examined with interest.

"It shows that the imports at the ports in California amounted to \$43,497,665 (of which \$42,821,945 came through the Golden Gate) while all the other Pacific ports (including \$1,754,422 credited to Arizona) received but \$8,523,548. Of the total exports (\$74,528,934) \$40,709,851 went from San Francisco; \$17,882,355 from Puget Sound, and \$13,880,314 from Oregon ports. The exports from Puget Sound are largely of lumber. The flour trade, also, with China and Japan has increased, and accounts in part for the export trade of Washington and Oregon.

"The tables showing the various articles imported and exported to and from Pacific coast ports furnish an interesting study, and it is believed for the first time are tabulated and published. The items do not necessarily indicate that they were produced here; for example, the item of cotton, of which we exported \$5,071,424, which came to Pacific coast ports from the Southern States and was reshipped, but the intelligent reader will readily note the articles of coast production.

"There is and will continue to be a sharp rivalry between Puget Sound ports and San Francisco for the controlling influence in the commerce of the Pacific. There are large transcontinental railroad interests centering at Puget Sound; the Canadian Pacific is also in the field for its share of the business. There is a large and rich agricultural country tributary to Puget Sound. We concede to our sister cities in the North great energy and enterprise, and we do not doubt that they will become, and we hope they may, prominent centers of a large and important trade with the Orient. In the nature of existing conditions this must be so. There was room and there was opportunity on the Atlantic coast for Boston, New York, Philadelphia, and Baltimore and many smaller cities, but there is one and can be but one New York City. So on this coast Washington and Oregon will build up large and important cities. The business that must develop in the extensive country lying to the east of that coast and the development of those two coast States will make large centers of trade a necessary result. All this conceded—conceded, too, with the spirit of pride that is so to be—we claim that San Francisco is destined ever to be, and it now is, the queen of the Pacific coast in America.

"In the first place California is capable of sustaining a population equal to that of Japan, with about the same square miles of area. The wealth-producing power of the State, which I have attempted briefly to show, is in itself sufficient to command the commerce of the coast, as it is to be its greatest contributor. San Francisco already has an accumulated surplus capital sufficient to throw at once into the avenues of trade all that may be required and as rapidly as may be demanded.

"San Francisco has the most accessible and the largest available harbor on the Pacific coast. Puget Sound is a vast body of deep water, but it can not be said to be an equally vast or available harbor, and the ports lie far away from the seacoast. Ships can anchor in safety in almost any part of the 460 square miles constituting the bay of San Francisco, including the tributaries of San Pablo and Suisun. This bay has a broad entrance, but 1 mile wide, and lies within 91 miles of the shortest sailing route from the Isthmus of Yokohama, and within 200 miles of the shortest sailing route from the Isthmus of Hongkong and our possessions in the Philippines. A glance at the map, constructed according to Mercator's projection, disputes this; but Lieutenant Maury and Captain (now Admiral) Sigbee long ago showed, the rotundity of the earth's surface considered, what I have stated to be true. Mr. William H. Mills, in the presence of this board, recently made a clear demonstration of the fact. The principle upon which this fact rests is stated to be that the shortest line between two points upon the surface of a sphere is the line which would cut that sphere into hemispheres. This is what is nautically known as "great circle sailing." Lieutenant Maury's discovery revolutionized the sailing charts of the globe, and its significance to us lies in the fact that San Francisco will be a way station for all steam sea-going vessels bound through the canal (soon to be) to and from Asiatic ports. Here will be a great depot for the supplies needed on the voyage and for coal, and to discharge and take on cargo.

"San Francisco is already a large city and is fully equipped for a large volume of business. It has extensive and commodious wharves which required time and much money to construct; and it has large trade connections already established throughout the globe.

"Whatever may be said of the policy, permitting them to come or to stay in this country, there is now a large and wealthy Chinese population in this city, which controls and brings here, and will continue to do so, a large part of the China trade.

"While the overland traffic, originating in the West along the parallels of latitude corresponding with Puget Sound, may come to the Pacific or pass east from the Pacific along these lines, the vast domain of the United States and the Republic of Mexico, lying far south from the overland roads from Puget Sound, must find inlet and outlet from and to the Orient through the Golden Gate. The trade of those regions will never go as far north as Puget Sound to ship for Asia.

"Travelers and traders from the South Sea Islands will seek the earliest port for disembarkation, where they can soonest escape the confinement of the sea voyage, and where, if they are merchants, they can supply their wants, or whence they can journey east across the continent or to Europe. San Francisco is that desirable point of escape from the monotony and perils of the sea.

"San Francisco is the best drained and most healthful city in the world, and withal picturesque and beautiful in its location. Not only its own attractiveness but the attractions of the State will bring people this way. Then to the climate of San Francisco is a distinct and positive economic advantage possessed by no other city on the globe. I know that many find it too stimulating and invigorating and resent the necessity for warm clothing the year around. But from the standpoint of general comfort to one not a confirmed invalid, and from an economic standpoint the climate is of incalculable value in the building of a great city. Seldom below 40 degrees or above 80 degrees, the temperature is such and the atmosphere so stimulating that physical exhaustion never comes from extremes of heat and extremes of cold are unknown. This is an important feature to the laborer, the artisan, the man in the workshops and in the factory, as well as to the man who toils with his brain or who lives for the mere pleasure of living.

"It is no part of the purpose of this report to describe San Francisco in detail, however much it might interest the commission. Departing from my resolve not to deal with localities there seemed to be justification for what has been inadequately said of our chief city in the fact that our State and its commercial metropolis are so closely interwoven and interdependent that at least some broad facts concerning our hopes for its future greatness were demanded. I should like to speak of San Francisco's people, of the architecture displayed in their homes and business houses, of the places of amusement, art galleries, libraries, the Golden Gate Park, the streets, facilities for getting about in the city, its picturesque surroundings, the exquisite beauty of the bay and its islands as adding to the charm of the city, the suburban attractions which add so much to life in a city, the historic seal rocks at the Cliff House, the unique features of Chinatown, the churches and general moral tone of the people, the influence the two great universities are having and must continue to have upon our intellectual life and growth, of the state of society here, of the general spirit of contentment and happiness pervading all classes, and a hundred other things which go to make up or express the civilization of this wide awake, energetic, restless, ambitious, and altogether hopeful population."

Q. (By Mr. A. L. HARRIS.) Before you pass to something else, what kind of manufacturing interests have you in California?—A. We have the shipbuilding manufacturing, and the beet-sugar manufacturing, and we have a great many other smaller manufactures in San Francisco.

Q. Have you mills for the manufacturing of flour?—A. Yes; many of those. We manufacture a large portion of our wheat into flour and ship it to China.

Q. Is your oriental trade increasing?—A. Very rapidly; it has almost doubled in the last 3 years.

Q. Do you look forward to a still greater increase?—A. Yes; it would seem so. The flour merchants are very sanguine; their trade was growing rapidly and they think will continue to grow.

Q. What are your shipping facilities?—A. The water route. The ships are the main freight route between us and China.

Q. Have you elevators for loading grain?—A. Yes; along the railroads and along the wharves there are elevators to store the grain.

Q. At what point are your grain elevators situated?—A. Most of the grain elevators are situated on the bay at the edge of the water transportation. We have rail or water transportation.

Q. Is your grain finding its way West now in place of East?—A. It is going in all directions, going to Europe, going to China, and to the East generally.

Q. Could you give the commission an estimate as to the comparative cost of producing wheat in California, as compared with other States?—A. Yes. I have not that data at hand, but it is thought by our expert men who are in the business that we can not raise wheat at a profit in California. It seems to be an unprofitable industry, and those largely in wheat raising have discontinued and are cutting their farms up and putting in fruit.

Q. Is that general or is it done in localities only?—A. It might be said to be general, although the change is not coming so very rapidly.

Q. Do you know the number of bushels your soil will produce to the acre?—A. Yes. We count our wheat there by the hundred—by centals. The best yields would be about 80 centals per acre, 80 sacks or 80 centals to the acre on the lands of the Sacramento bottoms. That is an unusual crop; it is a very large yield.

Q. What would you say would be the average?—A. I should say about 15 to 16 centals would be a good average for a fair year.

Q. Do you harvest and thrash at the same time?—A. Yes; our machine starts in cutting 100 acres a day and we sack it and put it in the warehouse ready for shipment.

Q. Is your land more valuable for raising other crops than wheat?—A. Yes.

Q. Even then at that good average production you find that you can not raise wheat?—A. We do not get that average every year. There is one thing peculiar about California. We need water; we get only two good crops out of five, and those are the two that I speak of. The others would be much lighter, probably be not one-fourth as great, so we would run 3 years at a loss and 2 at a profit, and, taking the 5 years, we find that wheat costs more than we get out of it.

Q. Do you raise any corn?—A. Very little. In some portions the people raise corn, but it is not general. It is not a corn State.

Q. What kind of grasses grow at a profit?—A. Alfalfa is the best grass we have for productiveness.

Q. Is California a good grazing State?—A. Yes; the mountains and the rough lands are very good for grazing.

Q. How far north can you raise oranges?—A. As far as Redding, 250 miles north of San Francisco.

Q. At a profit?—A. Yes.

Q. How large an area of the State, then, is suitable for the growth of oranges?—A. I should think about one-quarter of the State at least.

Q. Does that estimate apply to all kinds of citrus fruit?—A. Generally so. Where the orange will grow most any other citrus fruit will grow.

Q. How large a portion of the State is suitable for the production of deciduous fruit?—A. I should say about the same proportions—about one-fourth of the State. Of course there is about three-fourths of the State not suitable to raising any kind of fruit. It is too mountainous, too rough, but the suitable land would be something about my estimate—about one-fourth of the State.

Q. What kind of fruit is most profitable?—A. The oranges and lemons, I think, are the most profitable at the present time. Raisins have been profitable. There have been a large number of them grown.

Q. Do you raise any prunes?—A. Yes.

Q. What do you know, if anything, about a combine for the marketing of fruits in California?—A. I know there is at San Jose what they call the California Cured Fruit Association. They handle prunes largely, and it is said that they fix a price at which they sell their prunes and will not sell at any less, but what are the articles of combination I am not able to state.

Q. How much capital is invested in that association?—A. I am not able to state. They handle about 3,000,000 pounds of prunes.

Q. Do they fix the price to avoid a ruinously low price?—A. I think so; yes; to keep the article up to a price they can afford to sell at.

Q. Is the price fixed exorbitantly high?—A. I think not; about 3 or 4 cents a pound; some higher; some lower.

Q. Is there any complaint among the people generally in regard to this combination?—A. No; we hear very little complaint in regard to it with us.

Q. Is the combination confined alone to raisins and prunes?—A. I think it is, yes; as far as my knowledge goes.

Q. What was the condition of the industry of those two fruits previous to the formation of this association?—A. It was in a very poor condition before that time. The fruit raisers were not making anything, and at the present time I think they are doing fairly well. Their condition is much better now than previous to the organization.

Q. Does it have the advantage of preventing an overproduction in the market at one place and an underproduction at another?—A. I think so.

Q. Does it dispense with the middleman?—A. I think the association has its agents to sell its goods.

Q. Are the freight rates satisfactory, do you know?—A. I have heard no complaints whatever in regard to freight rates. There have been some complaints perhaps made in regard to the time that it takes the cars to get into market.

Q. Is there any competition in freights east from San Francisco?—A. There are

two lines of railways from San Francisco, the Sante Fe and the Southern Pacific. I think, however, they have about the same rate.

Q. Is there any understanding as to rates between the two roads?—A. Not that I know of.

Q. How large an industry is the dried fruit industry?—A. It runs up into the millions.

Q. Where does that fruit find a market?—A. Throughout the United States, and much of it goes to foreign countries.

Q. Does any portion of it go to the Orient?—A. I think it does, yes; to China. The large trade that we have to China is in canned goods.

Q. (By Mr. FARQUHAR.) What proportion of your wheat exports go around the Horn to the Atlantic coast or to Europe?—A. I should judge about three-fourths of it.

Q. Is your manufacture of flour on the Pacific slope sufficient for your local market, or do you have competition from other sections?—A. We manufacture all of our own flour from our own wheat in the State of California, and manufacture a large amount that is shipped abroad to Asia.

Q. So you supply all your local market and also export?—A. Yes.

Q. And you think two-thirds of the berry goes around the Horn?—A. I should think so, although I am not able to give the figures. I know there is a great amount of it being shipped by very large shippers there, who are making a business of shipping to Liverpool.

Q. Is the fact that you have to pay a large freight rate from the Pacific coast to the Liverpool market the reason that the raising of wheat in California doesn't pay as well as other crops?—A. No; I don't think that is the main reason.

Q. What is it?—A. The main reason is that we do not get sufficient water to get a good and certain annual yield. We have two or three failures out of five; that is the main reason that wheat growing does not pay.

Q. It is in the raising of the crop itself?—A. Yes.

Q. But does not the fact that you have got to pay a very large freight rate on the berry to Liverpool market reduce the profit to the California farmer?—A. It does to that extent. We get the Liverpool price less the freight rate.

Q. (By Mr. A. L. HARRIS.) Is there any complaint among the farmers of a combination to control the price of wheat?—A. Haven't heard of any.

Q. Neither in San Francisco nor in Liverpool?—A. We haven't heard of any; no.

Q. (By Mr. FARQUHAR.) Has not the California farmer got to take just what is offered by the foreign shipper?—A. When they get ready to sell that is the case. They sometimes hold a little, though—speculate.

Q. Can you hold wheat against the tonnage that is there ready to be taken into Liverpool or elsewhere?—A. Yes; it can be held in storage there for 2 years.

Q. Is that done at all?—A. It is done to a considerable extent, especially when the price is low, when the farmer will generally hold a while.

Q. Isn't your holding more for the local market, for local consumption, than for the export market?—A. We also ship to foreign markets from these warehouses that I speak of; ship all seasons of the year. There is no time, hardly any day in the week and every month of the year that there are not vessels going out.

Q. Did you say it was a positive advantage to the California farmer to have the grinding and to have the middlings and everything else saved in grinding at home rather than shipping the berry out of the country?—A. That is true. I think it would be an advantage to the farmers, as well as others, to have all manufacturing in the country.

Q. Is there any complaint among the farmers in regard to storage charges or the grading of the grain?—A. The storage charge per ton, I think, is 25 cents for 6 months, and that is not excessive. They don't consider it so. The insurance, however, comes in as a factor, and all those things makes quite a little expense, although it does not seem high.

Q. Your rule of grading is satisfactory?—A. Yes; it is. Because of the fact that we have no rain our grain is bright and it does not need much grading; it is already pretty well graded.

Q. Have you anything further?—A. Yes; I have an article about the oil industry I would like to present to the commission.

Q. (By Mr. TOMPKINS.) Olive oil?—A. No; the petroleum oil yield in California. There are now about 200,000 producing oil wells in California.

Q. How many?—A. Two hundred thousand. [Reading:]

"OIL YIELD OF CALIFORNIA.

"There are now about 200,000 producing oil wells in California, owned by more than 250 companies. Most of the yielding wells are in Kern, Los Angeles, Fresno, and Ventura counties. Prospecting is progressing throughout the State, and many hundreds of oil miners are employed at sinking experimental wells and finding sites for drilling rigs.

"Counties now claiming to be within the oil belts are: Alameda, Butte, Colusa, Contra Costa, Fresno, Glenn, Humboldt, Kings, Kern, Los Angeles, Monterey, Mendocino, Marin, Napa, Orange, Riverside, Santa Barbara, San Bernardino, San Benito, San Joaquin, Santa Clara, San Mateo, Sonoma, San Diego, San Luis Obispo, Solano, Santa Cruz, Shasta, Ventura, Tehama, Tulare, and Yolo. In several of the counties little has been attempted in the way of actual development, but in all of them indications are more or less favorable. Prof. W. L. Watts, of the California State mining bureau, has carefully investigated the cost of drilling oil wells to a depth of 1,000 feet, exclusive of the cost of casing, and gives the following statement as a consensus of opinion obtained by correspondence with well-known oil producers:

"Los Angeles and Kern River district, \$1,000 to \$3,500.

"The Puente Hills, \$3,500 to \$7,000.

"Newhall and territory of the north side of the valley of the Santa Clara River, \$5,000 to \$7,500.

"The foothills of the coast ranges on the west side of the San Joaquin Valley, \$2,000 to \$7,000."

"Col. L. P. Crane, president of the California Petroleum Mining Association, reports that 'Eastern capital to the extent of over \$40,000,000 has already invested in the oil fields of California.' Recent statistics of the value of the oil lands of the State, including the plants which are comprised in boring outfits, tankage systems, pipe lines, etc., reaches the sum of \$200,000,000.

"Careful computation shows that the crude oil yield of California for 1900 was about 4,000,000 barrels, and that the output for 1901 will be from 10 to 15 per cent more than that figure.

"The growth of the petroleum industry is indicated by the following statement, compiled by Charles G. Yale, statistician of the California State mining bureau:

	Barrels.
Yield prior to 1876	175,000
Yield in 1876	12,000
Yield in 1877	13,000
Yield in 1878	15,227
Yield in 1879	19,858
Yield in 1880	40,552
Yield in 1881	99,562
Yield in 1882	128,636
Yield in 1883	142,857
Yield in 1884	262,000
Yield in 1885	325,000
Yield in 1886	377,145
Yield in 1887	678,572
Yield in 1888	990,333

That must have been a mistake. I have 990,333 and must have meant 390,333.
(Continues to read:)

Yield in 1889	303,220
Yield in 1890	307,300
Yield in 1891	325,000
Yield in 1892	385,049
Yield in 1893	470,179
Yield in 1894	783,178
Yield in 1895	1,245,329
Yield in 1896	1,257,720
Yield in 1897	1,911,563
Yield in 1898	2,249,088
Yield in 1899	2,677,870

"Edgar F. Howe says that oil at \$1 per barrel is equivalent to coal at \$4.50 per ton, while the cost of coal here is about \$7.50 per ton. Oil is therefore as cheap a fuel in California as is required for successful competition in manufactures."

Q. (By Mr. LITCHMAN.) This oil is fuel?—A. Yes.

Q. (By Mr. FARQUHAR.) When you say fuel, you mean fuel for steam making?—A. Yes.

Q. (By Mr. LITCHMAN.) When you say it is used for fuel, you do not refer to illuminating oil?—A. Yes; fuel. It is not used for illuminating nor for house purposes.

- Q. It has too much sulphur?—A. That which has not been refined has.
- Q. (By Mr. A. L. HARRIS.) Has any effort been made to refine it?—A. I think there has been. There is a portion of the oil that is not of that character. There are quite a number of wells that produce illuminating oils. But the greater portion of it, I presume nine-tenths of it, is not illuminating oil, but about one-tenth of it is.
- Q. Are you adapting your furnaces to the use of the oil?—A. Yes; the Union Iron Works in San Francisco that manufacture the battle ships are now getting ready for the use of the oil, and Mr. Spreckels, in his large sugar factory, is using oil for fuel. The cotton mills at Oakland have been using it for the last year and a half or 2 years.
- Q. (By Mr. FARQUHAR.) Do the railroads use it?—A. The Santa Fe and the Southern Pacific are using it in their engines.
- Q. (By Mr. A. L. HARRIS.) Is it used for propelling ships or boats?—A. Yes; also for ships and boats and locomotives.
- Q. (By Mr. TOMPKINS.) Is not the making of olive oil an extensive business in California?—A. Yes; that business is quite extensively in operation there. There are a great many olive groves, and a great deal of oil is manufactured from the olive. And we manufacture the very best there is in the world. The French article or foreign article is supposed to be better, but I think that our California article is purer and not adulterated as much as the foreign article is. That is my impression.
- Q. To what extent is that business done, do you know?—A. I am not able to give you the number of gallons that are manufactured. I think, however, there are quite a number of those orchards that manufacture pure olive oil.
- Q. Do they adulterate it at all?—A. I think not.
- Q. Do they mix it with cotton-seed oil?—A. As far as my knowledge goes they do not. I have heard it stated by the manufacturers that it is not adulterated, but, of course, I do not know positively of my own knowledge. I could not state, but it has the reputation of being pure, that which is made in California.
- Q. About coconut oil, is there shipped into parts of California coconuts from different parts of the world and oil manufactured from them?—A. That may be.
- Q. I have heard that there was and I wanted to know.—A. Yes; it may be possible.
- Q. In fact I am pretty sure there is a mill in San Francisco.—A. I have no doubt there is, no doubt of it.
- Q. (By Mr. A. L. HARRIS.) Do the industries which you represent favor the construction of the Nicaraguan Canal?—A. Yes; all the coast is very favorable to that enterprise.
- Q. What advantage do you expect to receive when you now have land transportation?—A. Water communication regulates to some extent the rail transportation. If we have cheap water rates cheap rail rates will necessarily follow. If you have a rate from Chicago to Buffalo of 3 cents a bushel by water, the rail rates will come very close to that figure. That is what we think is our salvation, to get cheap water rates in order to lessen the freight rates.
- Q. Will the time be sufficiently short to permit you to ship your fruit?—A. It is thought so by those who seem to understand the problem, that we can get it quicker that way than we can by the other route, the present water route, much quicker.
- Q. There is one thing I intended to ask Mr. Turnbull and that is what the people of California feel in regard to reciprocal treaties.—A. As far as I am posted, the people of California would like to see present conditions remain. We do not like to lessen the tariff in any case.
- (Testimony closed.)
- Whereupon the commission at 4.15 p. m. took a recess until to-morrow morning, June 13, 1901, at 10 o'clock.

EXHIBIT A.

TRANSPORTATION FACILITIES—LAND VALUES—LABOR DEMAND—COST OF LIVING,

[By Gen. N. P. Chipman, President State Board of Trade, Chairman of Committee on Industrial Resources.]

Transportation.—I have no statistics since 1890, but in that year there were 5,061 miles of railroad in operation in the State. Since then the Valley Railroad has been built from Stockton, the Bakersfield, and is now completed, under the present ownership of the Santa Fe system, to San Francisco. The Southern Pacific

company has completed its coast line to Santa Barbara, and some other roads have been built. The Sacramento Valley, on both sides of the river, has rail facilities to Red Bluff, where the lines unite and proceed to Oregon. The San Joaquin Valley is well supplied. Indeed, railroad building has more than kept pace with the development of our industries. We have 3 overland roads to the East—the Central via Ogden, the Southern Pacific via southern California and Texas, and the Santa Fe system by southern California through Arizona and New Mexico, all having terminals at San Francisco. The roads coming to the coast into Washington and Oregon have agencies here soliciting business, using the sea as a connecting link to compel reasonable arrangements over the California and Oregon road. We also have the open sea via Cape Horn and the Isthmus to hold in check any disposition of the overland roads to enforce unfair rates. The coast ports and landings available for coastwise trade are very numerous, and the navigable Sacramento and San Joaquin rivers penetrate to the heart of the great central valley of the State, thus giving the producer some control of the rates of transportation through the interior.

Land values.—In 1890 I sold a carload (10 tons) of dried peaches f. o. b. Red Bluff, for \$4,000—20 cents per pound. Price for other fruits were equally high. It was not unusual for orange growers to net \$500 per acre from their lands, and fruit growers generally could show good interest on orchards valued at \$1,000 per acre. Fruit growing gave a fictitious value to all available fruit lands, and, as nearly all arable lands of the lower valleys are suitable for fruits, land devoted to general farming went to enormous figures—\$100 to \$300 per acre. Of course this condition could not last, and it would have placed a ruinous limitation upon the industry if it had lasted, for only the rich could eat fruit at those prices, whereas the success of the business depends upon reaching the mass of the consumers in the United States. Those early prices placed fruit in the category of luxuries, whereas success meant that it must be an article of food. All this has changed, and good fruit land alongside of a successful orchard does not take on value from the contiguity of the orchard. It is valued, just as the orchard is valued, for what it is producing. Lands that were held at the high figures named can now be purchased at one-third, or even less than the price in the "boom days" to which I have referred. In those days, too, large tracts were held by individual ownership, and the owners would neither sell nor subdivide. This, too, has changed, and great ranches are being broken up and offered at reasonable prices per acre in small tracts. There never was a more favorable time to secure homes in California, at fair prices, than the present. Causes which I need not mention, but which do not go to the desirability of California as a place to live and to make money, have brought all this about.

It should not be forgotten that land in a country having such climatic advantages is intrinsically of greater value than land of similar fertility where the conditions are less favorable.

Labor demand.—California has felt the impulse of the general prosperity which has returned to our country, and besides, is feeling the effect of our acquisitions of new territory in the Pacific. These things have given an increased demand for labor, so much so, indeed, that employers find great difficulty often in carrying forward enterprises. Wages have always been, and still are, higher here than in the Eastern and Western States. A few years ago I would have hesitated to advise laborers to come to this coast, but present conditions fully warrant doing so now.

Cost of living.—It should follow that in a country so rich and productive the cost of living would be low, and so it is. The prices for the necessities of life, fruit, vegetables, meat, flour, etc., are cheaper here than in the East. Logically, this must be so, since, with the exception of meats, we have a large surplus to send East, and the cost here is thus regulated in a large degree. For example, wheat and flour take a price equal to the price at the foreign point of sale, less the charges to get it there. In other words, Liverpool fixes the prices of wheat here. This rule does not quite hold good in all articles. But the statement that the cost of living here is much less than in the East can not be disputed. The fact is shown in the prices charged at our first-class hotels, which are proverbially much below those charged in Eastern cities for like accommodations. The annual cost to the laborer for clothing is much less than in cold countries, where the inclemency of the weather demands greater protection to the body.

AGRICULTURE AND AGRICULTURAL LABOR.

ALBANY, N. Y., May 22, 1901.

STATEMENT OF HON. CHARLES A. WIETING,

Commissioner of Agriculture of the State of New York.

The pursuit of agriculture in New York State is not as profitable as it was from 1860 to 1873, but conditions are improving, and it looks to me as though the year 1901 will be more profitable for the farmers of New York State than the preceding years.

From 1860 to 1873 all farm products brought extremely high prices on account of the great demand caused by the war of the rebellion. Farm products bringing high prices made the value of lands high, and farms were sold at high prices. Many of them were bought on time and mortgaged. After the close of the war the demand for farm products gradually grew less, prices became less, and the price of land shrank accordingly, so that many of the farmers of the State of New York, who had bought lands and mortgaged them, lost them by shrinkage of value.

The main causes for the cheapening of the value of products were the increased supply of cereals coming from the rapid development of new territory, and the extension of railroad facilities reaching into the newly opened territory and the greatly reduced rates of transportation, of which that new territory received the benefit and of which New York State has been deprived, and the lack of demand for those products by nonproducers and consumers becoming producers and ceasing to be consumers on the market.

To illustrate how rapidly the Western territory was developed, I call attention to the fact that reports from the National Government show that the original area of land belonging to the people at large was 1,815,504,147 acres, of which 806,532,362 acres has been alienated. For the year 1897 the following is a table showing the rate of transfer to private ownership, viz:

To 1884	591,987,814	1890	12,665,532
1884	26,834,042	1891	10,357,232
1885	20,113,663	1892	13,566,552
1886	20,991,967	1893	11,801,686
1887	25,111,401	1894	10,377,225
1888	24,160,785	1895	8,364,300
1889	17,026,092	1896	13,174,071

This shows an alienation to private ownership of nearly 23,000 square miles per annum, or 1,305,041 acres per month, or 43,501 acres per day, or 1,812 acres per hour, or 30 acres per minute; that is, 1 acre every 2 seconds. It is fair to estimate that the produce of this land went into direct and immediate competition with the products of the farms of the State of New York, which were valued at from \$50 to \$150 per acre, and which had been farmed until the soil required much fertilizing. The western lands had been untilled, were rich, and required no fertilizer. Then, in addition to that advantage, the Western farmer was enabled to place his goods upon the Eastern markets by paying greatly reduced freight rates, in some cases being able to put his goods on the market for as little money as the Eastern farmer had to pay for placing his there.

In a report made by Mr. George T. Powell, of the State of New York, upon "Agricultural Conditions and Needs," he calls attention to the fact that in 1870 the freight on a bushel of wheat from Chicago to New York was 30 cents, while in 1890 it was reduced to 14½ cents, a decrease of 52 per cent, and that in the year 1870 the freight

from Chicago to New York by rail on a bushel of corn was 28 cents, while in 1890 it was reduced to 11½ cents, a decrease of 59 per cent. No similar decrease in freight rates in favor of New York farmers, who desire to send their goods to New York markets, was made during that period of time. It has been entirely in favor of the great producing West as against the producers in New York State. This will apply equally as well to other farm products. The results produced in this way are working against the New York State farmer, and a similar condition of things in other countries is operating against not only the farmer in New York, but all the farmers in the United States. For instance, the great wheat fields of South America and Australia and those that bid fair to be opened in Siberia make the prospect of the New York farmer raising cereals at a profit quite discouraging. He must, in my judgment, in order to succeed from an agricultural standpoint, turn his attention to other products; possibly, yes, I may say probably, to those that are known as perishable products that can not be transported a great distance, such as fruits, vegetables, dairy and meat products, and some others.

With this end in view the authorities in the State of New York are doing what they can to meet the situation by causing instruction to be given each year along lines that have a tendency to help the farmer in producing these crops, with the hope in view that they will thus be able to stem the tide that is cityward and possibly turn it back toward the farm. In other words, they are attempting to disseminate sufficient scientific agricultural knowledge among the people so that farming may be considered a profession rather than a drudgery. To that end we are spending thousands of dollars a year.

A notion has prevailed to some extent heretofore to the effect that education unfitted a person for farm life, that, as a result of his education, he was bound to enter into one of the professions. That idea is fast becoming one of the past among New York farmers, as we now have in our State many young men who are well educated who are devoting their knowledge and energies to the work of farming and who take as great pride in it as in a profession. This makes the outlook somewhat brighter, as such farmers become business men, keeping books in which they have an account with their farm. They understand that in order for the farm to successfully feed them and those they leave after them they must also feed the farm as they go along—i. e., they can not rob the soil of its strength without placing back in it something to compensate for what they have taken out.

Should conditions change so that the scope of the market for cereals should be enlarged, for instance, by the annexation of territory, this would be of great advantage to the farmers of New York State, as it would not only make a market for the cereals, but make a market for the products of the shop and manufactories of the country, thus enlarging our home market and also making a demand for agricultural products.

It has been said that the farmer of New York State is laboring under a load of taxation that is disproportionate. I can not agree with those who hold this idea. I find upon inquiry into the subject that the average farmer in the State of New York owning a farm of 100 acres does not pay a tax to exceed \$25. I can hardly accept the proposition that a matter of \$25 a year is going to make a difference between good and hard times upon a farm of 100 acres.

In addition to the load that the farmers of New York and other Eastern States have been carrying for many years, as above referred to, is the one of adulterated food products which is of great injury to them from the fact that the imitation and adulterated goods are so manufactured as to resemble the pure goods made by the farmers and palmed off on the unsuspecting consuming public as the genuine article. This injures the market, to say nothing of the fraud practiced upon the consumer. We have for a number of years been spending much money by giving instruction in making first-class butter and cheese. We believe we have reached the point where we can say that all New York State full-cream cheeses are now of a uniform first-grade quality, yet we find that manufacturers of inferior goods in other States are imitating the brand which is being placed upon these cheeses and placing it upon cheeses of an inferior quality made in other States. This is a wrong not only upon the cheese producers of the State of New York, but also a wrong upon the consuming public, and it should be stopped. I believe that if the National Government should enact a law and provide for its enforcement to the effect that no food products should be falsely branded as to the State in which they are made, it would stop this fraudulent practice. I believe that the National Government has that constitutional power under that clause in the Constitution giving them power to regulate commerce between the States.

There is another law, I think, which Congress should pass, namely a law providing that when any dairy or food products are transported from one State to another they should immediately become subject to the laws of the State, irrespective of package or form in which they are done up; the same as the law enacted relative to whisky, known as the Wilson whisky bill. This, I believe, is no more than a fair proposition, because when a State has fought hard and long, and at a great expense

to provide its citizens with nothing but pure food products it is an outrage to allow a manufacturer of impure goods in another State to send his wares in in original packages and sell them, perhaps fraudulently, to the unsuspecting public.

Q. (By Mr. WEST.) What would you say as to the earnings of capital in agriculture compared with other lines of business?—A. That is a particularly hard question to answer. You can water the stock on a farm but it does not add anything to its value, it only keeps it where it is. It is safe to say, however, that the profits are very much less in agriculture than in other lines of business. There are no large salaries paid out of the profits of agriculture.

Q. Do I understand you to say that the farmers are not unfairly taxed as compared with city residents?—A. They will not be under the new tax law of this State.

Q. Is property in this State, speaking generally, assessed at its full value?—A. Well, it is supposed to be. Farms are assessed for not quite their full value, and I think the same is true of city and village property. If it were to be sold at auction I do not know that it would bring more than it is assessed for, in many cases.

Q. Does property in the city often sell for more than its assessed valuation?—A. I should imagine that it would, in a great many cases, unless it was sold for some special purpose; it would be difficult to say. Property often does sell for more than its value.

ALBANY, N. Y., May 22, 1901.

STATEMENT OF HON. GEORGE L. FLANDERS,

Assistant Commissioner of Agriculture of the State of New York.

Q. (By Mr. WEST). Is the employment of scientific methods of farming on the increase in New York State?—A. Yes.

Q. To what do you attribute that increase?—A. To the teaching in the agricultural schools and colleges, and the instruction given at our farmers' institutes, of which we hold three or four hundred a year.

Q. What can you say about the keeping of farmers' books on the double-entry system? Do the farmers of the State commonly open accounts with their crops, so that they know at the end of the year whether they are profitable or not?—A. Some of them do; the younger farmers who have been educated at the agricultural college and many who are taking the advice of the institute workers are doing so.

Q. That would apply, among others, to the farms owned by rich men?—A. I imagine a number of them would not care to see the books; but there is a gentleman who has a hen farm who knows exactly what his hens pay, making due allowance for the different breeds, and keeps the books evenly balanced. The farmers' institutes have done a great deal toward getting the farmers to do this, as well as toward educating the older farmers. Many farmers who are keeping cows have never tested the milk of each cow separately, and think that the one which gives the most milk is the best cow, when the butter may not be of as good a quality as that made from the smaller amount of milk from another cow, and so they often sell the wrong cow. But our dairymen are coming gradually to understand that every cow they keep that does not pay offsets one that does, and are applying tests at given intervals to determine what ones are profit-producers and what ones are burdens upon the dairy. On the whole I think it is safe to say that the farmers of this State are moving in the right direction in their work and doing it with a reasonable rapidity. The legislature has made provision for several years last past to the end that the literature and good advice as to the most approved methods of farming along different lines may be laid before them, and it is having its effect. This is applied to all lines of plant growth and dairying.

Q. Will the annexation of territory result disadvantageously to the agricultural interests of the country?—A. On the whole, no. There may be minor adverse conditions, but, on the whole, it will open a large market for American goods and give work to a number of people, and when that is done agriculturists will be profited proportionately with those in other callings.

Q. In the matter of the official label for New York State full-cream cheese, do I understand correctly that that label has been counterfeited?—A. Yes, sir. It has been counterfeited to considerable extent, largely in Chicago. The brand is issued by this department to the different cheese manufacturers in this State. The statute provides that it shall bear the words "New York State full-cream cheese," and a different number for each factory. The State has been for a number of years giving instruction to the different cheese makers within its borders to the end that they might produce here a uniform, first-grade article. The statute also provides for the issuing of the cheese brand to the different factories, to the end that the purchasing

public might know the quality of the goods they were purchasing when this brand was upon them. Some dealers in cheese in the West, particularly in Chicago, evidently conceived that it would be a very enterprising scheme to imitate that brand, which they did, and placed it upon cheese of an inferior grade made elsewhere than in the State of New York. This practice is ruining the reputation of cheese makers in this State as to the quality of cheese they produce, and is also taking from them their reputation for integrity, and, of course, ruining our market. We desire in this State to have the National Government do something to stop that condition of affairs.

Q. Is your official brand registered as a trade-mark?—A. It can not be done. The same principle is involved as in the South Carolina whisky case, where the people of that State wanted to brand their whisky with the word "Palmetto," but the courts held that it could not be done. This department has sent representatives to Washington on several occasions to see whether we could take advantage of the patent laws or copyright laws to stop this false branding, but we were informed by the authorities that it could not be done. A person registering a trade-mark must have a proprietary interest in it. The commissioner of agriculture or official of this State registering such a trade-mark would not have that interest in it, and to ask the proprietor of each cheese factory in this State to file his particular brand as a trade-mark and pay \$25 would be a burden which they would hardly feel they could afford; but even if they could do that another difficulty arises, namely, that if persons in other States used the brand wrongfully it would involve the private individual who had a proprietary interest in the brand in a lawsuit in the United States court, the expense of which the large majority of our cheese makers could not bear. That method of handling the matter is impractical.

Q. What would you suggest as a remedy?—A. That the National Government exercise the power conferred upon it by the National Constitution to regulate commerce between the States by enacting that no dairy or food products used in interstate commerce should be falsely branded or labeled as to the State in which they are manufactured or produced. A bill to that end was introduced in the last Congress by Mr. Sherman, from New York, and introduced in the Senate by Senator Depew, from this State, and reported favorably by the committees in each branch to which it was referred, but did not finally pass. A bill was introduced by Mr. Sauerhering, of Wisconsin, which provided that the governors of the different States might file a trade-mark at Washington, to be known as the State trade-mark, which might be used upon any goods of any kind whatsoever manufactured within the different States, but its use prohibited upon goods manufactured in any other State, and that no two trade-marks so filed from different States should be the same. This bill was defeated.

Q. Would you have the law cover anything further than what you have just stated?—A. I would have the law cover all dairy and food products, so as to stop fraud in interstate commerce. That power was given to the National Government to exercise, and it should exercise it to the end that no fraud should be practiced which may injure the consuming public, because the States themselves are powerless to take care of interstate-commerce questions.

Q. Has your State authorized the use of the words "New York State" upon any other product than cheese?—A. Not that I am aware of.

Q. Then, applying this legislation to all dairy and food products, would you extend it to other cases than the fraudulent use of the name of the State?—A. I can see no reason why all fraud in interstate commerce should not be stopped by the National Government. The National Government is given power to regulate commerce between the States. Just how much that means I would not undertake to state in this interview. I certainly am of the opinion that the National Government has power to enact and enforce the law that we are asking for. In that opinion we do not stand alone. This question was a matter of serious study for some time prior to our taking a positive stand upon it, and we consulted some of the best patent lawyers of this State. The opinions of such men were without exception to the effect that Congress had the power to enact the statute referred to.

Q. Has there been any trouble in this State over violations of the oleomargarine law?—A. Yes, sir; but we are detecting those who violate it and proceeding against them for it. These violations are, however, few, when you consider the size of the State and the population. The violations are in almost every case clandestine.

Q. Are these violations, any of them, by people outside of the State?—A. Yes. In November of 1899 our attention was called particularly to violation on a wholesale plan by a Chicago firm, or so-called firm. We investigated it fully. A man in Buffalo was selling this oleomargarine and branding it renovated butter; and when we discovered it there were about 200 tubs in the store. He claimed he had been deceived, and we were unable to prove to the contrary. There were two companies—the Elgin Produce Company and the Aurora Produce Company.

Q. Were these the names of actually existing companies?—A. They were fake companies doing business under cover for certain oleomargarine industries.

Q. Do the large manufacturers of oleomargarine conduct their business in a legitimate way?—A. Yes; we think so. There are exceptions, and the percentage is an open question.

Q. Were these goods marked as required by the national law?—A. No; there was nothing whatever to indicate that the tubs contained oleomargarine; it was evident that these dealers had some way of procuring the goods without their being stamped and marked as required by the national law. That law requires, among other things, that the label placed upon the tubs shall have 5 tacks driven through it. There were no marks anywhere on the tubs indicating that tacks had thus been driven in.

Q. Was the butter packed in the tubs at the original place of manufacture?—A. We do not know.

Q. Why should oleomargarine be labeled renovated butter?—A. Because it was made in such good imitation of butter it could easily be palmed off on the public for renovated butter, when the same public would not buy oleomargarine.

Q. But they could not palm it off as fresh butter?—A. Possibly they could, but they expected to deceive the public better by selling it for renovated butter.

Q. Which do you consider the more desirable article of food, oleomargarine or renovated butter?—A. Renovated butter, by all means.

Q. And the reason?—A. Because one is a butter fat and the other is a fat that was never intended to go into the human stomach raw. It takes more effort to digest oleomargarine than it does to digest butter.

Q. May I ask you to state the percentages of stearin and butyric acid in butter and oleomargarine, respectively?—A. I am informed that Dr. Wiley, chief chemist of the Department of Agriculture at Washington, stated that oleomargarine contained from 4 to 5 times as much stearin as butter; and he estimates that good butter contains from 4 to 8 per cent of butyric acid, while oleomargarine has but a trace of it.

Q. Do I understand you to say that butyric acid is an aid to digestion?—A. Yes.

Q. Is it an oil chemically similar to stearin?—A. I can not tell you what it is; I am not a chemist.

Q. Can you refer the commission to any definite evidence on this point?—A. I refer you to Dr. R. D. Clark's second annual report made in 1886 to the New York State dairy commission; also to my testimony before the United States Senate Committee on Agriculture and Forestry, beginning at page 121 of its report,¹ and especially to the statements quoted on pages 134 and 136.

Q. The commission would like to know what your State department of agriculture is doing.—A. The State department is an outgrowth of the old dairy commission which was created by an act of 1884, chapter 202, of the laws of that year. Its purpose when created was to stop the sale of adulterated milk in the State of New York and to stop the fraudulent sale of oleomargarine as and for butter. This commission continued as such until the year 1893 with little change, except that during that period there was an educational branch added to it for the purpose of giving instruction to the farmers of this State in making uniform, first-class products, to the end that the commodities might appear on the markets of the world as first-grade goods. In 1893 the laws were revised, the name was changed to the department of agriculture, and outside work was given to it, until now it has much more work to do. The educational work consists of imparting as much knowledge as possible to the agriculturists of the State through a bureau connected with the department known as the bureau of farmers' institutes. The work of that bureau is to impart the best ideas relative to agriculture to the people of the State directly engaged in agricultural work.

In the executive part of the work, the department now stops the fraudulent sale of oleomargarine as and for butter, filled cheese, cheese falsely branded as to quality, stops the sale of impure and adulterated milk, the sale of calves under 4 weeks of age, the sale of sugar made in imitation of maple sugar, the sale of vinegar containing less than 4 per cent acetic acid, the sale of adulterated linseed oils, and the sale of condensed milk containing less than 25 per cent of butter fat. The department is also charged with the enforcement of the law for the suppression or prevention of contagious and infectious diseases of domestic animals, also with the suppression or extermination of infectious or contagious diseases of fruit trees. The work in the last two above-named departments is not small when you take into consideration that there are a million and a half milch cows in the State of New York, to say nothing of other cattle, and that there are nearly 500 nurseries in this State producing fruit trees for sale, all of which have to be examined.

The department also distributes money appropriated by the legislature to encourage the culture of sugar beets in this State, to the end that it may become a strong and permanent industry within the State. It also distributes money appropriated by the legislature to agricultural fairs for the purpose of promoting agricultural industries. Last year the amount distributed was \$147,000.

¹ Senate Report No. 2043, Fifty-sixth Congress, second session.

It is fair to say in this connection that when this department was first created oleomargarine was manufactured and sold in the State of New York as and for butter in large quantities, hundreds of thousands of pounds per year; to-day there is none manufactured within the State, and very little sold, and what sales are made are clandestine.

Since the enforcement of the milk laws the milk routes have increased in number and have extended in length. At the time of the creation of the department the milk taken to New York City over milk routes was between 3 and 4 million 40-quart cans. This amount has increased annually under the enforcement of the law until last year it took between 13 and 14 million 40-quart cans to supply the demands of the city. What is true of New York City is proportionately true of other cities of the State. People are now sending milk from Elmira to New York; formerly it was bought within a few miles round about. The people of Rochester now go from 75 to 100 miles out to get their supply of milk. That is the outcome of the enforcement of the law, which calls for more milk and less water.

Q. The commission would like to know through what hands the typical consignment of milk passes?—A. Why, there is usually a milk station to which all the milk is carried, and it goes from there of a uniform quality. The stations are usually owned by the man who owns the routes in New York, but in some cases the milk is sold to the peddler.

Q. After it reaches New York?—A. In many cases the milk is consigned directly from the station.

Q. Are you familiar with the work of the Five States Milk Producers' Association?—A. We are not sufficiently familiar with the work of that association to feel competent to make any statements. You had better consult its president or secretary, Mr. F. B. Aikin, of Trumansburg, N. Y.

The State of New York has expended large amounts of money during the last 15 years in producing the results that now exist, to the end that the consuming public shall not be defrauded relative to these particular food products, and the request the State now makes of the National Government is that that Government may exercise such power as has been conferred upon it to regulate commerce between the States, to the end that those who would deal fraudulently with the consuming public may not be enabled to do so by virtue of the fact that the State governments have no control over such commerce.

Q. Have you anything further to suggest under the head of remedial legislation?—

A. Well, as to that, the Grout bill, which was before Congress, if enacted and enforced will, in our judgment, remedy some of the evils that have existed in this State, which are caused by the people of other States shipping their goods into this State in original packages and endeavoring to sell them in violation of State laws. That bill provides that whenever dairy or food products are brought into a State, immediately upon entering they shall become subject to the State law to the same extent and in the same manner as if they had been products of the State, etc.

Q. Have you anything to say with reference to the scarcity of farm laborers?—

A. On that question I would not care to enter into a discussion. The question was investigated at the expense and under the direction of an association formed in New York City, known as the Association for Improving the Condition of the Poor. Mr. George T. Powell, of Ghent, N. Y., is now at the head of a school which is the outgrowth of that investigation. This department has no authority to reach out and investigate such questions. Our work is defined by the statute under which we act. It might, at times, seem proper for us to investigate some such questions, but our work is determined by statute.

Q. These statistical questions are all left to the bureau of labor statistics?—

A. There is a bureau of labor statistics created in this State, and its duties are defined by statute.

Q. Does it go into the matter of agricultural statistics?—A. There are no statistics of agricultural products collected in New York State under the auspices of the State, that I know of, except relative to butter and cheese manufacture.

Q. What is the attitude of the farmers of the State toward the Agricultural College?—A. Favorable; and many of the farmers of the State who are succeeding are those who are sticking close to the scientific principles of farming.

Q. Will you say something further about this school of which Mr. Powell is the director?—A. I can not say anything about it, as it is just started. I believe the motive of the school is to undertake to do something to turn the tide of young men from the city back toward the farm. It has been quite a study in this State how to turn that tide—how to make the calling of farming sufficiently interesting and remunerative to keep the young man at home on the farm. The Briar Cliff Farm is only one farm of many that are run by capital which stands back of them.

Q. It is a question whether the farm pays or not?—A. A number of these farms do not pay. You will find that many are run by people who make their money elsewhere and spend it on the farm.

Q. And these farms are unprofitable?—A. No; I would not say that, but they are not run as a matter of financial gain; they are run more as a matter of pride.

Q. With reference to the shrinkage in the value of land after the close of the war, is the present tendency in the price of farm land upward or downward?—A. My notion of it is that it is improving, but not enough to speak about. Some farms, however, have sold for less than the cost of the buildings upon them.

Q. About when was the turning point?—A. In the neighborhood of the nineties.

Q. Are farm values increasing at present in all parts of the State?—A. I think there is a slight increase in values; they are not on the decline.

Q. Are there any abandoned farms in New York State?—A. Well, I do not really know; few, if any.

Q. Are the prices of farm lands increasing as rapidly as the price of the land in the cities?—A. No.

Q. Now, on the question of taxation: Are the assessments in the cities raised as rapidly as the land increases in value?—A. I am not familiar with that question. I know one man who loaned money on farms and had to buy 60 of them in himself, so you see he was not making any money on them.

Q. Are the prices of farm products still on the increase?—A. That is largely regulated by the crop of the year.

Q. With relation to the treatment of diseases among trees, has the State committed itself to a policy?—A. It has provided that nurseries shall be inspected, and wherever the diseases are found, means are employed to eradicate them and prevent their spread. Whenever a company receives a consignment of nursery stock from other States, immediately upon such receipt it must notify this department from where it was received and the destination, and by this means we are helped in the prevention of the spread of disease.

The legislature of 1901 placed in this department the treatment of tuberculosis and glanders among domestic animals. In all cases except tuberculosis we are producing good results, but on that we have just commenced. Also as to the suppression, if possible, of foul brood among bees. We have a peculiar difficulty in the new disease which is commonly called black brood, which is very nearly akin to foul brood. The law gives us authority to suppress foul brood, but says nothing about black brood. This illustrates some of the many difficulties with which we have to contend in the enforcement of the law.

Q. Are the statutes too specific?—A. I think there is danger of being too specific in the statute. Sometimes you find the law stops you from doing the principal thing which you are expected to do.

ALBANY, N. Y., May 22, 1901.

STATEMENT OF MR. PETER DEYO,

Secretary of the New York State board of tax commissioners.

Q. (By Mr. West.) Are you in a position to state how the valuation of farm property in New York State compares with that of other property?—A. The assessments upon which the State taxes are levied are returned to the controller by the clerks of the board of supervisors of the different counties, and the only subdivision in the counties is the assessment by cities and towns. There is no division between farm land and village property. The local assessors, when they appear before this board, state generally that they assess property at full value, as the law requires, but there are people who volunteer the information that that is not a fact.

The table for the equalization of State taxes is based upon percentages supposed to represent the percentages which the assessed value bears to the real value, so far as the tax commissioners are able to obtain the facts. It is not absolutely a correct table except as to what the State board of equalization believes to be a relative basis for a distribution of the tax.

It has been the opinion of the commissioners who form this board, since I have been here, that, generally speaking, farm property is assessed more nearly at the real value than city property, and for the reason that farm property in this State has greatly decreased in value.

Q. And the assessments have not been correspondingly reduced?—A. No.

Q. In the cities have the assessments increased and kept up with the increase in values?—A. Yes; and due probably to improvement and growth. In some instances the cities are obliged to increase their assessments in order to reach some improvement they desire to make by a bond issue.

Q. There is some testimony to the effect that the prices of farms have lately taken to increasing in New York State?—A. I do not think so.

1000 HEARINGS BEFORE THE INDUSTRIAL COMMISSION.

Q. Are they still declining?—A. Well, that seems to be largely the evidence brought to this board. There were some gentlemen here from Minneapolis recently who said farm land had advanced in Minnesota. They had been appointed by the governor to investigate taxation.

I have been trying for the past 2 years to get the corporate assessments of the various counties separated from the other assessments; they are all reported together. I have a table here for that purpose, which, when revised, will be published in next year's report. It shows that the proportion of corporate property is surprisingly small, ranging from 12 per cent in New York County to 31 per cent in Schenectady, and averaging 14½ per cent for the State. This includes steam railroads, 3.47 per cent; street railroads, 1.6 per cent; telephone and telegraph companies, .25 per cent; gas, electric-light, and power companies, 1.15; banks, 2.73 per cent, and miscellaneous, 5.33 per cent.

The board also publishes a table showing the amount of property in each county exempt from taxation (Report for 1900, p. 34). This is not an exact statement of the facts for the reason that under the bill providing for these returns only property in cities which was on the assessment roll was returned. There is a great amount of municipal property in villages, and State property in other districts that was not returned under this law, but the last legislature provided that in the future returns shall be made of all exempt property in every town and city.

In the last report of the board of tax commissioners the following statements were made:

"Farm lands in this State are assessed more nearly their full value than any other form of realty. Low water and rail freight rates for products of cheap Western self-fertilizing lands have hammered down the worth of an Eastern farm to \$25 and \$15 per acre, frequently far less, from the \$100 and \$75 per acre value the same acreage bore before this latter day unequal competition with the West and slight participation of personal in tax paying. The descent in value has been steady and sure, until the assessors' mark has now, in most instances, become high as compared with other property. Some relief from this condition is expected from abandonment of cereal crops and resort to specialization in stock breeding, dairying, or fruit growing; but the transition is slow and difficult, as are all revolutions. The long droughts of 1899 and 1900, in large areas of the State, have contributed temporarily to discourage those who till the ground and are dependent upon the seasonableness of the seasons."

This touches the difficulty of ascertaining the exact percentage which the assessment bears to the full value. It is because in every locality there is certain property which, by reason of certain conditions, has become very desirable or undesirable, and it is the undesirable property which is usually placed upon the market at forced sale, and under such conditions the price does not always represent the full value. I think usually it is the property that is worth, say, from \$1,000 to \$5,000 that is assessed most nearly at full value. The more expensive buildings, both residences and manufacturing or business property, usually show the widest difference between the assessment and the value of the property, both in the city and in the country.

ITHACA, N. Y., May 29, 1901.

STATEMENT OF PROF. B. E. FERNOW,

Director New York State College of Forestry.

Q. (By Mr. WEST.) How came the New York State College of Forestry to be instituted, and what is its object?—A. The New York State College of Forestry was instituted by act of the legislature of New York State of March 26, 1898, for two objects, namely: To educate foresters, and to make a demonstration of practical forest management on a tract of timber land in the Adirondacks. The history of its origin may be briefly stated as follows: The State of New York had, by various acts, declared for a policy of forest preservation, with a view to protecting the watershed of the Adirondacks. In 1885 the State possessed a property of some 600,000 acres of timber land, acquired by tax sales, mostly culled, and more or less maltreated, and a forest commission was instituted for its management. Although the commission had the power to do whatever was necessary to institute technical forest management, it failed to secure expert advice and to formulate any coherent plan. It exercised the power to cut timber by selling stumpage to lumbermen, who continued to cull the woods of the valuable spruce and pine in the same manner as before, and in consequence those who saw in this method of treating the woods danger to their continuance and to their effectiveness as protectors of the watershed, brought about the insertion of a clause into the constitution which forbids the cutting of any trees

Q. And these farms are unprofitable?—A. No; I would not say that, but they are not run as a matter of financial gain; they are run more as a matter of pride.

Q. With reference to the shrinkage in the value of land after the close of the war, is the present tendency in the price of farm land upward or downward?—A. My notion of it is that it is improving, but not enough to speak about. Some farms, however, have sold for less than the cost of the buildings upon them.

Q. About when was the turning point?—A. In the neighborhood of the nineties.

Q. Are farm values increasing at present in all parts of the State?—A. I think there is a slight increase in values; they are not on the decline.

Q. Are there any abandoned farms in New York State?—A. Well, I do not really know; few, if any.

Q. Are the prices of farm lands increasing as rapidly as the price of the land in the cities?—A. No.

Q. Now, on the question of taxation: Are the assessments in the cities raised as rapidly as the land increases in value?—A. I am not familiar with that question. I know one man who loaned money on farms and had to buy 60 of them in himself, so you see he was not making any money on them.

Q. Are the prices of farm products still on the increase?—A. That is largely regulated by the crop of the year.

Q. With relation to the treatment of diseases among trees, has the State committed itself to a policy?—A. It has provided that nurseries shall be inspected, and wherever the diseases are found, means are employed to eradicate them and prevent their spread. Whenever a company receives a consignment of nursery stock from other States, immediately upon such receipt it must notify this department from where it was received and the destination, and by this means we are helped in the prevention of the spread of disease.

The legislature of 1901 placed in this department the treatment of tuberculosis and glanders among domestic animals. In all cases except tuberculosis we are producing good results, but on that we have just commenced. Also as to the suppression, if possible, of foul brood among bees. We have a peculiar difficulty in the new disease which is commonly called black brood, which is very nearly akin to foul brood. The law gives us authority to suppress foul brood, but says nothing about black brood. This illustrates some of the many difficulties with which we have to contend in the enforcement of the law.

Q. Are the statutes too specific?—A. I think there is danger of being too specific in the statute. Sometimes you find the law stops you from doing the principal thing which you are expected to do.

ALBANY, N. Y., May 22, 1901.

STATEMENT OF MR. PETER DEYO,

Secretary of the New York State board of tax commissioners.

Q. (By Mr. WEST.) Are you in a position to state how the valuation of farm property in New York State compares with that of other property?—A. The assessments upon which the State taxes are levied are returned to the controller by the clerks of the board of supervisors of the different counties, and the only subdivision in the counties is the assessment by cities and towns. There is no division between farm land and village property. The local assessors, when they appear before this board, state generally that they assess property at full value, as the law requires, but there are people who volunteer the information that that is not a fact.

The table for the equalization of State taxes is based upon percentages supposed to represent the percentages which the assessed value bears to the real value, so far as the tax commissioners are able to obtain the facts. It is not absolutely a correct table except as to what the State board of equalization believes to be a relative basis for a distribution of the tax.

It has been the opinion of the commissioners who form this board, since I have been here, that, generally speaking, farm property is assessed more nearly at the real value than city property, and for the reason that farm property in this State has greatly decreased in value.

Q. And the assessments have not been correspondingly reduced?—A. No.

Q. In the cities have the assessments increased and kept up with the increase in values?—A. Yes; and due probably to improvement and growth. In some instances the cities are obliged to increase their assessments in order to reach some improvement they desire to make by a bond issue.

Q. There is some testimony to the effect that the prices of farms have lately taken to increasing in New York State?—A. I do not think so.

what he leaves; he works for his present pocket interest, without conscious regard to the future; the forester cuts it with a view to securing a second, third, and continuous, and, if possible, better, economically more valuable crop; he works for the present and the future; he must be willing to forego some of the present profits, which the lumberman takes, for the sake of future profits, which the lumberman does not take into consideration. The lumberman compares to the berry picker in the wild woods; the forester to the market gardener, applying skill in the production of his crop.

There are two parts to forest management, just as in any other technical business, agriculture included. There is the technical part and the business part, namely, silviculture, which is the art of using the forces of nature so as to secure the best wood crop, and forest economy, which concerns itself with the business arrangements. The time element, the long period between the starting and the harvesting of the crop, from 50 to 100 years and more, renders the business arrangements peculiar and, *sui generis*, different from any other business, and hence, especially on account of the time element, as a business by itself, forest management does not recommend itself to the small capitalist. It is peculiarly a business for large capital and for the State or long-lived concerns, like communities. The State, especially, is concerned in the future, is long lived, and hence can afford to forego present revenue or spend money now for the sake of future satisfaction.

Of the three factors of production, nature, capital, and labor, in forest management, the last counts least; hence the small capitalist who expects to secure by intense application of skill the largest margin from his capital has here the least opportunity, except under very special conditions. The large capitalist, who can wait while nature is accumulating the wood crop, who does not want to depend upon labor and its uncertainties, who wants a safe continuous investment with sure though comparatively small returns, is best fitted to carry on the forestry business.

Q. Is forest management profitable?—A. No business can be said to be profitable except under certain given conditions. Forestry, applied to our virgin woods as a business, working as it does for the future, can certainly not be profitable immediately, except under very favorable and particular conditions, namely, on very large areas of well-stocked timber with large capital. In the long run, however, it can be made, and will become as profitable as any other business, and as it has become in Germany and other countries. As long as virgin supplies, which have cost nothing to produce, compete in the market, there is naturally little inducement to apply skill and labor, i. e., money, upon the production of wood crops. Nevertheless, the time has seemingly come when natural supplies of timber ready for use have been sufficiently reduced to foreshadow a balance between supply and demand which may call for effort to increase the former, and those who are now beginning to look out for the future will undoubtedly reap their reward. This is especially true with certain kinds of timber supplies, notable pulp wood.

Reliable and intelligently computed statistics on standing and growing timber supplies—which do not exist and are, to be sure, most difficult to obtain—would stimulate the forestry business more than any other agency. Here is where the Federal Government should have long ago taken the initiative.

Q. What relation has forestry to agriculture?—A. Forestry can utilize the soils which are not fit for agriculture; hence there is not necessarily any interference from that point of view. The farmer should keep all the poor parts of the farm for wood cropping, which, incidentally, will bring him profits from the otherwise useless portions. Besides, in certain locations, the beneficial effect of a forest cover, as on hill tops, steep slopes, especially with still, impermeable soils, and the protection against winds may induce location of wood lots even on agriculturally valuable soils. The farmer can practice silviculture on his wood lot, applying such principles as I have outlined in *Farmers' Bulletin No. 67*, United States Department of Agriculture, entitled "Forestry for Farmers."

But it is not to be expected that the farmers' wood lots will ever furnish the enormous supplies of log timber—at present not much less than 40,000,000,000 feet, B. M.—which our market requires. Not only would it not pay for him to allow his trees to grow as long as is needed for such log timber, but even silviculturally speaking, the wood lot is fit only for growing firewood, posts, poles, and small dimensions. Log timber must be grown on large contiguous areas by large capitalists who can afford to have their capital tied up for a long time and are not tempted to cash it as soon as it becomes possible.

Q. What relation has the College of Forestry to the State forest commission?—A. There is no direct organic relation between the college and the commission, except that the commission is by law required to furnish protection against fire on the college tract. By implication, rather than by direct language, the commission should choose its professional employees from the graduates of this college, and last year it did so employ the first and only graduate. The commission might also apply to the college for any expert advice that it may desire in formulating plans for the

management of the State's forest property. Such a relation has so far, however, not developed, and in fact no attempt at professional forest management has been made; the commission, as far as forestry interests are concerned, has hitherto only exercised police powers, preventing forest fires and stealing, enforcing the game and fish laws, looking after contracts arising from the purchase of timber lands under reservation of certain kinds and diameters of soft woods, etc.

The constitutional clause prevents the commission from doing any forestry work which necessitates the cutting of trees. There would, however, be many other opportunities for forestry work on the 1,500,000 acres controlled by the State, like the planting up of burned areas, the survey and subdivision of the forest property, the taking of stock preliminary to future plans of management, in which the commission could be assisted by the college and employ its graduates.

Q. What is the policy in the management of the college tract, and what has been accomplished?—A. The college tract is typical of the Adirondack woods; a hard-wood forest composed of sugar maple, yellow birch, and beech, mixed with spruce and hemlock, and in some parts white pine, besides some other species occurring sporadically. Most of the college forest has been culled by lumbermen of the merchantable pine, which is nearly extirpated, and of the spruce, which has thereby been considerably reduced. It is, therefore, the leavings of the lumbermen—a forest culled of its most valuable materials—which has been set aside for this experiment. There are, besides, the usual balsam and cedar swamps and considerable areas of burned lands, grown up to aspen and white birch, where formerly the white pine was the dominant tree.

The silvicultural policy, briefly stated, is to replace the old decrepit natural forest by a new, more valuable forest, more or less rapidly.

The financial policy is to bring about this change in the conditions of the property, as far as possible, by using only the profits which come from the harvest of the old crop. The first step necessary was, therefore, to find a market for the hard wood, which did not exist locally. Since the hard woods do not float, railroad construction is absolutely necessary for transporting the harvest out of the woods. This means that a comprehensive plan for the entire harvest is necessary. Since the proportion of logs to cord wood in these hard woods is about as 1 to 3 or 4 in volume (that is to say, there is from three to four times as much wood fit for cord wood as for logs), and since for the success of the young crop the debris of logging must to some extent be taken care of, it was even more essential to find a market for the cord wood than for the logs. Consequently a contract was entered into with the Brooklyn Cooperage Company to erect stove mills to use the logs, wood-alcohol plants to use the cord wood, and a railroad for the purpose of taking out the entire hard-wood crop, logs, and cord wood that might be cut for the next 15 or 20 years.

In this way the market question—the most difficult one to solve—for the least salable part of the crop was settled at once. The company has invested a large amount in construction of mills and railroad, and the first year's cut has been made, harvesting from 500 acres about 2,500,000 feet of logs and about 8,000 cords, besides small quantities of soft woods which it became necessary to remove. Close utilization of every part of the trees cut, the saving of the little odds and ends and of the inferior materials, must be attempted to secure the profit.

Regarding the reproduction of a crop, various methods are available. The object being to have the relatively more valuable conifers reproduced in preference to the hard woods, whatever young conifer growth is present is to be saved in the logging, and occasionally seed trees of conifers as well as hard woods are to be left to fill out the crop. A satisfactory natural reproduction, however, requires that the old crop be removed gradually while the young crop is gradually developing, giving light to it as the different species require. But such a procedure—gradual or repeated logging over the same area—is costly. The scanty allowance of working capital has prevented it in the first season. Besides, nearly all the hard-wood trees, even the small or young ones, are defective and unpromising, mostly owing to injury by fire, and should therefore be removed, being mere runts, while the spruces which might be left as seed trees, being shallow rooted, are readily thrown by winds in the severer openings; hence it appears in many places preferable, less expensive, and surer of results to artificially secure the young crop by planting. Consequently large nurseries, in which plant material is grown from seed to be transplanted to the woods when 2 or 3 year old, have been established. In these mainly white pine and spruce, together with other coniferous species, are grown, more than a million seedlings being now on hand.

Planting is done only with conifers, since the hard woods are able to reproduce themselves readily without assistance, furnishing a sufficient amount of this desirable admixture. This at least is the theory upon which the management has, so far, proceeded. The burned areas and openings are also to be gradually planted up to useful species. So far about 165 acres have been planted for experimental purposes in varying manner.

The most difficult problem here, as elsewhere, unsolved, and taxing either ingenuity or the purse, is protection against fire and getting rid of the unavoidable débris that comes from logging when the brushwood can not be disposed of. An attempt to utilize the latter has so far not proved a success financially. Against the fire danger constant patrol seems to be the only help, all other means seemingly being more expensive and less effective.

Ithaca, N. Y., May 30, 1901.

STATEMENT OF PROF. L. H. BAILEY,

Of the College of Agriculture in Cornell University.

If farming is unprofitable, the farmer moves to town; thereby is the balance of population disturbed and our economic equilibrium upset. The agricultural status concerns the city man as well as the country man. Whether there is an agricultural decline depends largely on the point of view; that is, on the kind of measure with which we measure it. We have erred in measuring the agricultural status by the means that we are accustomed to use in other industries. The farm not only produces a certain product, but it is the farmer's home. The question is not one of economics alone, but quite as much of social statics. If one were to ask 20 farmers whether agriculture is undergoing depression, he would likely receive 20 kinds of answers, depending largely on the personal experience of the respondent. One can arrive at a satisfactory conclusion as to the agricultural status only by taking a broad view and by considering the averages of many conditions. He will arrive at truer conclusions by knowing the actual conditions and aspirations of farmers than by studying statistics alone.

Judged historically, agriculture itself can not be on the decline. The "good old days," of which we hear so much, were days of less production, narrower range of effort, poorer ideals of living. A series of contrasts will illustrate this fact.

The best information concerning the agricultural status of this country at the close of the eighteenth century is that contained in the correspondence of George Washington, particularly in that part of it conducted with Arthur Young, the famous English agricultural writer. At Young's suggestion, Washington made an inquiry into the condition of agriculture, and this inquiry was published after Washington's death. Although the farming lands were then relatively new, nevertheless the yield of crops was remarkably small as compared with that from the same regions to day. R. Peters, for example, living at Belmont, within 6 miles of Philadelphia, writes in 1791 that "about 8 bushels of wheat per acre is a full allowance for the better kind of farms in these parts. Some do not yield 6, and eight out of ten do not come up to 8 bushels per acre." He also reports that a dairy of 8 cows should give an average yield of 2 pounds of butter per week for each cow, making an average through the year of 101 pounds, or 832 pounds for the herd. At the present time the yield of wheat in Pennsylvania and adjacent regions averages at least twice the figures given by Mr. Peters, and the best farms much exceed that amount. The ordinary farm dairy to-day, in that region, should average 250 pounds of butter to the cow, and the best herds will exceed that figure.

The general low state of agriculture in Virginia may be judged from the following extract from one of Washington's letters, written from Mount Vernon in 1787: "The cultivation of tobacco has been almost the sole object with men of landed property, and consequently a regular course of crops have never been in view. The general custom has been, first, to raise a crop of Indian corn (maize), which, according to the mode of cultivation, is a good preparation for wheat; then a crop of wheat, after which the ground is respited (except from weeds and every trash that can contribute to its foulness) for about eighteen months; and so on, alternately, without any dressing, till the land is exhausted; when it is turned out, without being sown with grass seeds or reeds or any method taken to restore it, and another piece is ruined in the same manner. No more cattle is raised than can be supported by lowland meadows, swamps, etc., and the tops and blades of Indian corn, as very few persons have attended to sowing grasses and connecting cattle with their crops. The Indian corn is the chief support of the laborers and horses. Our lands, as I mentioned in my first letter to you, were originally very good; but use and abuse have made them quite otherwise."

Following is a sketch of the products of a good farm in Bucks County, Pa., in 1791. It is "an estimate of what may be supposed the average annual product of the different articles raised on the lands" near Philadelphia:

"Quantity, 200 acres; value, 3,200 dollars. Two hundred acres being nearly the

average quantity of the farms in this quarter, have taken that as the most convenient portion from which to form the required estimates.

"*Arable land*, 125 acres. The arable land, divided into five fields, of twenty-five acres each, makes in the whole 125 acres.

"*Pasture*, 50 acres. The course of cropping pursued here requiring three fields to be under tillage, two of course will be left for pasture, which make 50 acres.

"*Orchards, &c.*, 10 acres. Orchard, garden, house, and barn, yards, lanes, &c.; supposed to occupy 10 acres.

"*Meadow*, 15 acres. The natural meadows in this part of the country being few, yet as every farmer finds means for allotting some portion of his land for that use, suppose the nearest average 15 acres.

"*Woodland*, 50 acres. Timber being an article indispensably necessary for fuel, fencing, building, &c., have allowed 50 acres for that use.

"*Wheat*, 200 bushels, at 90 cents per bushel, is 180 dollars. One of the aforesaid fields is allotted, in rotation, for wheat and rye; suppose twenty thereof to be sown with wheat, will yield, *communibus annis*, ten bushels per acre; for although in seasons, on well improved grounds, twenty, thirty, and even thirty-five bushels may be produced from the acre; yet from the many casualties to which land tillage is exposed, so that in some seasons the best improved ground may not produce even five bushels; have, from my own observation, and that of an intelligent neighbouring farmer, taken the above as the nearest supposed medium, making two hundred bushels; which, at 90 cents per bushel, is 180 dollars.

"*Rye*, 50 bushels, at 60 cents per bushel, 30 dollars. Rye likewise, ten bushels to the acre; the remainder of the field, being five acres, will yield fifty bushels, which, at sixty cents per bushel, make 30 dollars. N. B.—The field on which the wheat and rye is sowed is generally also put in with grass, and lays for pasture two years.

"*Corn*, 300 bushels, at 40 cents, 120 dollars. One field is generally allotted to Indian corn and buckwheat, in the same proportion with wheat and rye; the 20 acres of corn will average 15 bushels per acre, making in the whole 300 bushels, at 40 cents per bushel, is 120 dollars.

"*Buckwheat*, 75 bushels, at 30 cents, is 22 dollars and 50 cents. This grain is so precarious in its growth that it is extremely difficult to form an estimate of its general produce; but suppose 15 bushels per acre, which, from five acres, being the remainder of that field occupied by the corn, will be 75 bushels, valued at 30 cents per bushel, is 22 dollars 50 cents.

"*Barley*. So little of this grain is raised here that I did not think it worth notice. "*Oats*, 100 bushels, at 20 cents per bushel, 20 dollars. By the course of cropping commonly used here, this grain is sowed for the sake of ease and convenience to the farmer, upon some part of the fallow intended for wheat, to which it generally proves injurious, therefore is not largely propagated; have only allotted five acres, which will average twenty bushels per acre, making in the whole 100 bushels, at 20 cents per bushel, is 20 dollars.

"*Flax and seed*, 30 dollars. This is also generally raised on part of the fallow; suppose two, which, on an average, may yield 250 pounds of swinged flax and 12 bushels of seed, which, both together, may be worth 30 dollars.

"*Apples and cider*, 30 dollars. Every farm has more or less of orcharding; eight acres allowed for that use, the product whereof in apples and cider can not be worth less than 30 dollars.

"*Hay*, 20 tons; value, 120 dollars. Although 15 acres only are allotted for meadow, which, probably, on an average, will not yield more than that number of tons, yet as the farmers by sowing grass seeds on their lands, improved with dung, plaster of paris, &c., annually mow more or less of those, I have allowed 20 tons, worth six dollars each, makes 120 dollars.

"*Cattle*, annual product, 70 dollars. I suppose a farm of 200 acres will, on an average, support 12 head of cattle; of those, I suppose five milch cows, which will each yield per annum one calf, two of them to be raised and three fatted, the latter worth six dollars. Five milch cows will produce fifteen pounds of butter per month each for seven months, which makes in the whole 525 lbs., at nine cents per lb. makes 47 dollars 25 cents, five months allowed for their being farrow or fattening the calves. Two calves annually raised affords opportunity for disposing of that number of cattle annually, either in beef or milch cows, which, being worth 16 dollars each, makes 32 dollars, making in the whole 79 dollars 25 cents. Deduct for accidents, &c., nine dollars 25 cents, leaves an annual product of 70 dollars.

"*Horses*. Whatever these may produce must be considered as included in the general product of the farm, for the cultivation of which they are made by the propagation of the animal, unless it be in the most interior parts of the country where no market can be procured for grain, &c.

"*Sheep*, annual product, 28 dollars. Twenty store sheep may be conveniently kept on a 200-acre farm; their wool will average 40 pounds per year, worth 23 cents per pound, which makes 10 dollars; their increase in lambs, twelve; this number being to be disposed of annually, either in lambs or fatted mutton, they may be worth 18

dollars each, makes 18 dollars. Thus the whole annual product on sheep will be 28 dollars.

"Hogs, annual product, 80 dollars. Ten hogs may be considered as the average number raised annually on a 200-acre farm; weighing 200 net pounds each, making 2,000 lbs., at four cents per lb. the value of the annual product will be 80 dollars.

"Poultry, annual product, 10 dollars. Suppose, on an average, ten dozen may be raised, worth one dollar per dozen, their product will be 10 dollars.

"Wood consumed in fuel, 25 cords. Allowing one kitchen fire, which burns more or less the whole year, and one other fire during the winter, for the convenience of the family, I suppose the two fires will consume 25 cords.

"Consumed by cattle, horses, sheep, hogs, and poultry: Indian corn, 200 bushels; rye, 25 ditto; buckwheat, 40 ditto; potatoes, 75 ditto; hay, 20 tons.

"The family consumption may be estimated by what will support nine persons, viz, the man, his wife, and three children, one man hired by the year, one bound boy, and one girl, the extra hiring of hands in harvest and haymaking, spinsters, visitors, &c., equal to the maintenance of one person more during the year.

"Tax paid annually for defraying the expenses of the country, supporting the poor, and repairing the roads will average about \$8."

This account shows that a good farm of 125 acres of arable land in eastern Pennsylvania could be expected to produce at that time 200 bushels of wheat, 300 bushels of corn, 100 bushels of oats, 75 bushels of potatoes, and 20 tons of hay. I have asked a representative farmer of eastern Pennsylvania to estimate what the average yield of such a farm would be in 1900, and he reports as follows: Wheat, 1,250 bushels; corn, 1,500 bushels; oats, 500 bushels; potatoes, 500 bushels; hay, 50 tons; tobacco and other crops not mentioned. That is, the average productivity of a farm is four or six times greater to-day than it was in the same section 100 years ago. This fact is illustrated in the most remarkable way in the contrasts of fruit growing of the two centuries. In 1791, for example, it was estimated that 8 acres of orchard should produce apples and cider worth not less than \$30, or less than \$4 per acre. A first-class apple grower at the present day would be satisfied with nothing less than a net profit of ten to forty times this amount.

There are many reasons why farms are more productive to-day than they were 100 years ago, notwithstanding the fact that the amount of available plant food may be expected to have decreased rather than increased. One reason for the increased productiveness is the use of better tools. Another is the use of commercial fertilizers, which were unknown a hundred years ago, and the general appreciation of the value of tillage and of rotation of crops. The farmer now has more fundamental knowledge of the laws that underlie productiveness, and is thereby able to prosecute a more rational system of farming. There are better markets and more competition at the present day, thereby stimulating activity and inquiry. A greater range of products is in demand. Diseases and insects are under better control. It is apparent from a review of this history that, with the possible exception of the thoughtful provision for spinsters, the whole plane of farming has raised immensely.

The opinions of representative farmers on the agricultural outlook are of the greatest value. They are first hand. They are born of experience. From a recent correspondence with New York farmers on the general subject of the agricultural status, I have selected 20 replies. These replies represent the various opinions on the subject of the so-called agricultural decline, and suggest nearly or quite all the possible remedies, aside from those proposed by political partisans. The authors of these letters are substantial farmers, representing several great branches of agricultural pursuits, as stock raising, dairying, grain farming, fruit growing, and general mixed husbandry.

1.

"There is much depression in agriculture in this section, mainly from drought. As a preventive, I suggest exemption from taxes of a certain per cent of land holdings when in natural forest or reforested. I believe this plan should be pressed upon the legislature. Industrial stimulation is rapidly decreasing the supply of good farm labor."

2.

"I think that there is a depression in agriculture, or at least agriculture is not receiving sufficient reward for the amount of labor bestowed upon it. The cost of production does not favorably compare with the selling price of farm products. The farmer is either paying too much for labor or he is not getting sufficient price for the products of the farm. There is too much difference in price between producer and consumer. Too many are becoming wealthy upon the products of the farm after leaving the farmer and before reaching the consumer. To give the producer the benefit of 75 per cent of this difference will place agriculture upon a footing that will restore the neglected farm improvements of former years."

3.

"I would say that there is a decided depression; and one proof is the very low present value of farming real estate. Farms have been selling for one-fourth to one-third of values a few years since. And why? Perhaps several causes. Perhaps increased taxation, bearing most heavily on the visible and easily found farming property; perhaps the high cost of labor, which is a large item of expense; perhaps the new and fertile Western lands with the cheap transportation, for the West is a strong competition in grain, beef, pork, and butter; perhaps agriculture is undergoing a transition condition. A proof of change may be the drift of population away from the rural parts and toward the cities and towns. Farming responds to business changes the last of anything, while the iron and steel industries feel the changes so quickly as to be considered the business barometer. I have sometimes thought that farming is in the condition of reaction from former prosperity, and the same law of reaction must soon bring improvement."

4.

"There is depression, as shown by the depreciation in farm values of one-third to one-half. Abundant proof of this might be cited.

"Causes: First, overproduction; second, failure of farmers to recognize the changed conditions and adjust themselves thereto. The only farmers I see making money now have excelled in some one thing."

5.

"There is certainly a decline in agriculture. The splendid railroad system and low rates for long hauling of freight and cheap lands West make it discouraging to try to live and educate your children. It can not be done here in New York State raising cereals." [But this correspondent is a very successful and thrifty fruit grower.]

6.

"The question as to whether there is any agricultural depression or not, seems to me can be answered with yes or no. When I compare the sales of farm produce as kept by my father in 1840, as kept by myself in 1860, and as it is selling to-day, and the expense of producing it at the three different periods, there would be more surplus money to-day than at the other times. When we take into consideration the changes that have taken place and the difference in our surroundings, we find that the price of agricultural products has not kept pace with our necessities, consequently there is a depression. Take some examples—first, taxes. An ordinary farm of 100 acres has to pay not far from \$70 yearly. This would take the raising, marketing, etc., of 100 bushels of wheat. Second, take our insurance, repairs, clothing, groceries, etc., and we soon find \$200 gone. This takes 400 bushels of shelled corn, or ordinarily 700 bushels of potatoes. Suppose we want to send our boy or girl to the high school in a nearby town and we have this bill for one term of 14 weeks: board at \$3 per week, \$52; tuition, \$7.50; books, etc., \$5.50; net, \$65. This to-day would take 225 bushels of oats. Four terms a year would take 900 bushels. An ordinary family, with 100 acres of land free from incumbrance, has hard work to make ends meet."

"Some of the causes: Gambling in grain; wealthy corporations controlling the price of some farm products; high taxes, partly the result of expensive and high-salaried officers (school-teachers not wholly exempt); trying to keep up appearances so that we may compare with our city cousins, etc.

"One more example may be cited showing the difference between the pay received by intelligent farmers and some public officers. My judicial district has 6 judges, who receive \$42,000 annually. The farmers taking milk to our depot to-day are receiving 2½ cents a quart. Paying the judges' salaries in milk would take 1,680,000 quarts. There is an honest, hard-working farmer going past my place every day (4 miles) over the bad roads with 60 quarts of milk to help pay their salaries. In his case ignorance is bliss. What if these judges had to take their pay 1 year in milk? How much land and how much hard labor would it take for the above bill, and how many carloads would it make?" [This farmer evidently forgets that only a part—and that probably a small part—of the salaries is paid by farmers.]

7.

"It seems to me that the foundation step of real progress among the farmers is based on the question of cheap and rapid transportation; otherwise the farmer, 20 miles from market is in the position that the fruit growers in California were of

1008 HEARINGS BEFORE THE INDUSTRIAL COMMISSION.

having immense crops of beautiful fruit decaying on their hands because the freight rates were so heavy as to prevent their being sent to market. A farmer intelligently operating his farm 20 miles from the market and having good crops and choice things to sell loses the self-incentive of commercial gain. The moral incentive of being a successful producer is there, but it does not bring him bread and butter."

8.

"There should be an effort to improve the condition of the farmer by improving his methods of selling his produce. It is not necessary to introduce evidence to prove that this needs doing. The sales should be made by using a representative farmer for salesman, one who is adapted to the work, well supplied with information, who has enough of the smaller products of the farm that he can ship economically, enough stock so that he can afford to advertise and command the attention of large buyers, one whose knowledge of qualities is sufficient to assure a correct response to a distant order, and whose known responsibility will convince the buyer that he has a ready redress if his order is not honestly filled. We also should cheapen and at the same time improve methods of packing and shipping by securing uniformity in size and kind of packages, and complete reform in the present tendency to pack deceptively and in undersize packages. We should sell more and more as time goes on by filling orders direct from farmer's hands through his agent, thus checking the tendency to 'glut' the market by untimely shipments. Since the farmer has to pay the entire expense of getting his produce into the consumer's hands, no matter how he markets it, he can economize largely on present methods, and a penny saved here is more than a penny earned. If it costs 15 cents per pound to produce butter, then the man who sells it for 16 cents makes 1 cent per pound, but if he saved another cent a pound by selling more economically, he makes as much as if he had produced another pound of butter. In other words, adding 1 cent to the price is as good to him as doubling his output. The farmer needs educating right here. He does not appreciate the difference between the total price and the small fraction left to him as his own, and consequently does not realize the immense importance of the additional fraction added to the price. It is far within the mark to say that the cost of distribution is 10 per cent of the total value as at present managed. This can be reduced if the produce is handled in a wholesale way."

9.

"Agriculture has been passing through a period of severe depression in all countries for a quarter of a century, owing primarily to great changes in transportation. While France and Denmark are gaining, our own country is rapidly leading the world in improvement. When methods are adapted to changed conditions, this improvement is most marked. Present prices for most agricultural products may be considered as returning good profits."

10.

"While there is no 'boom' in this section, I do not believe that there is any depression. Farms are advancing in price. Hay, beans, potatoes, and apples are selling fairly well, wheat alone being below what it ought to be."

11.

"Is there an agricultural depression? It depends. If you mean land values, yes. Farm after farm in New England, New York, and Pennsylvania can be bought to-day for two-thirds the cost of buildings. A farm in this county once sold for \$100 per acre was lately sold for \$30. Land my father sold for \$60 per acre has since sold for \$15.

"If you mean farm-product values, no. Butter, pork, cheese, etc., are as high as the average for the past 3 years.

"If you mean farm wages, no. I pay 12½ cents per hour for men. My father hired just as good men for 7½ cents per hour."

12.

"In my judgment there is no real depression in agriculture. I think that there has never been a more favorable time to buy a farm and pay for it from the soil than now."

13.

"There is certainly a depression in land values compared with 20 years ago, caused doubtless by immense tracts of Western land coming under cultivation, and we can not compete with Western farmers in raising wheat. My idea for farmers of this

State is this: Work toward a specialty. It is my opinion that the farmer who attends to his business as strictly and intelligently as the business man in town need have no fear of agricultural depression. On my farm of 40 acres, my specialties are apples and potatoes, and without boasting I can say that the results are very satisfactory."

14.

"The best evidence that we have that agriculture is on the decline is the number of abandoned farms throughout the country. The causes are:

"(1) The prime cause is ignorance, and that word implies so much that I will not attempt to define it.

"(2) Five-sixths of the tillers of dear old mother earth have no heart in their work.

"(3) And having no heart in their work, they totally neglect proper cultivation, which is the foundation of all farming and more important than all else excepting one factor, and that is good seed.

"(4) Cost of fertilizer.

"(5) Poor farming, poor pay.

"(6) Farmers, as a rule, have an idea that they must live on the husks, and thereby bring discontent and unhappiness to the household.

"(7) And last, but not least, the farmer and his life companion do not pull together in many cases.

"A man who can not see, even without book knowledge, some beauty and satisfaction in the sowing and the harvest has no place in God's grand old laboratory."

15.

"My observation in our section is that farming has paid better in the last 2 years than for several years previous. Farmers have been raising a greater variety of crops."

16.

"I do not think that agriculture is in a depressed condition at the present time, but on the other hand that we are at the beginning of a period of prosperity that will equal, if not surpass, that which has been experienced in the mercantile world. The reason that I have for believing this is, that when the consumers are well employed and paid they will naturally live better and consume more."

17.

"I do not think agriculture is on a decline. Perhaps it does not make the progress found in other business. If not, I would attribute the cause to lack of proper education and business methods on the part of the farmer."

18.

"I fail to see any general agricultural depression. While undoubtedly many farmers who work along the methods of 40 years ago, trying to raise crops of grain as their fathers did, are hard up, the progressive, up-to-date farmer is doing better now than for many years. I have noticed that those farmers who stick to raising grain and hay for sale are gradually raising smaller crops, but those who mix in a liberal amount of stock growing or feeding, or who keep cows, have their land growing better and more productive."

19.

"It is very difficult to express the situation in a few words. The financial rewards of the farmer are not commensurate with the knowledge, skill, and labor required of him to succeed. Therefore there is depression.

"The causes are to be found in legislation as affecting land values, in taxation, transportation, and education. When 60 per cent of the farmers are as well educated as the best 30 per cent are now, all this injustice will disappear. But it does not follow that agriculture is now on the decline. On the contrary, it is on a rapid, steady, upward incline. Knowledge is the push and skill, the steering arrangement that is impelling it forward. For the intelligent, educated, industrious farmer there will be the greatest prosperity which the profession has ever known. But for the ignorant, uneducated, average farmer there is nothing for encouragement. He can not keep up."

"The depression in agriculture is apparent rather than real. The farmer thinks that agriculture is on the decline because he compares his income and expenditures of to-day with those of the last generation, or with those of the city man who has more capital invested. Considered with reference to the amount that one can produce from a given quantity of land, agriculture has not declined, but has decidedly improved.

"The causes of the so-called agricultural depression are associated mostly with the failure of the farmer to adjust himself perfectly to the changing conditions of the time. As a result much of the depression is local. For example, the condition of abandoned farms in New England has come about very largely because great areas of new land were opened up in the West and the competition in the old-fashioned staple crops became too severe. As soon as the farmers of New England learn how to grow the things for which New England is better adapted than the West is, or which their markets demand, in better condition, the condition may be expected to improve. Another reason for the apparent decline in agriculture is the change in social conditions. The farmer may earn as much as he did years ago, or even more, but he has to spend the greater proportion of it in keeping up with the times. He feels that he must have all the things that the city man has. The piano has taken the place of the melodeon, and the carriage of the democrat wagon. The farmer sometimes forgets that he has a great deal which the city man does not have."

Of these 20 replies only 6 seem to indicate that there is a general depression in agriculture; and even in these cases the decline does not appear to make the respondent hopeless. The general assigned causes of the so-called agricultural depression are chiefly the following: First, economic conditions, comprising depreciation of farm values, inequalities of taxation, the high charges between the producer and consumer, the drifting of population toward the cities, the competition due to the opening of the West, overproduction, the increase of governmental expenses, and the fact that the farmer reacts slowly to economic changes; second, poor roads, whereby the farmer is at a disadvantage in the market and is socially ostracized; third, the lack of good farming and of the ability to take hold of the new knowledge and inspiration of the day, as seen in the need of education and of business method, in the tendency to follow old lines of effort, in the lack of specialization; fourth, social conditions, comprising the relative isolation of the farmer and the consequent unattractiveness of his life, the fact that he does not appreciate his business, the great increase of expenses due to his effort to provide what may be called the luxuries of life.

It is apparent, from a review of the preceding discussion, that the remedy for the so-called agricultural decline lies very largely with the farmer himself. The general economic conditions are largely beyond his reach and control—as, in fact, they are beyond the reach of men in other business. The farmer reacts so slowly to changing conditions that his adjustment to them comes after all other businesses have become thoroughly accommodated and revitalized, and in the meantime he suffers. This lack of quick adjustment is due, in part, to the inherent conditions of country living, whereby people are scattered far and wide. It is due, also, to the fact that farmers have less inherent community of interest than men in most other vocations. Farming is not one occupation, but many occupations. One farmer makes a specialty of sheep, another of potatoes, another of peaches, and another of carnations. It is not to be expected that men with such varied interests can organize into a compact body, for the basis of the most efficient cooperation is commercial benefit.

It may be asked what is proposed in the way of legislation to relieve the difficulties under which the farmer labors. The bills introduced in a recent legislature of the State of New York may be taken as fairly representing the range that such remedial legislation can profitably take. Thirty-one special bills were introduced in aid of the agricultural interests. A large number of these were regulatory and police measures. One made it obligatory upon State institutions to give preference to New York State products when buying supplies. One proposed to make it mandatory upon commission merchants to render to the consignor the names and addresses of purchasers, thereby affording the farmer a check on the middleman. One related to regulations concerning the sale and analysis of feeding stuffs. Eight had to do with adulteration and regulation of articles of food and feeding. Two related to sugar beets. Four were concerned with establishing legal sizes of packages. Four protected the farmer from nuisances, as weeds and rabbits. One sought to check the spread of diseases of bees. One related to the control of commercial fertilizers. Two appropriated money for the furtherance of agricultural education. With the exception of the two bills to promote education, all the 31 proposed measures aimed only to protect the farmer and to give him a fair chance to work out his own salvation. They could not make him a better farmer nor relieve any fundamental difficulty.

It may be well to make a hasty review of some of the causes that are commonly assigned for the agricultural depression.

1. *The economic condition.*—The most emphatic indication of a decline in agriculture is the depreciation of farm values. In nearly all parts of the country, particularly in the East, values of real estate have depreciated 25 per cent and more. This depreciation represents decline when measured by fixed indebtedness, but it is not decline when measured by the possibilities of a present-day investment. It is said that farmers can not hold their lands and pay their debts. These debts, however, were contracted years ago, in most cases when farm values were high. They were contracted on a rising or perhaps inflated market, and they are being paid on a falling market. All farmers agree that it is possible to produce more per acre at the present day than a generation ago. Valuations of farm properties have decreased. It is therefore apparent, if prices have not depreciated, that the income from investment in farm lands to-day is relatively greater than a generation ago. When farm values are low it is the time to purchase farms if one desires to make a living from the proceeds. In this view, therefore, the decline in farm values promises well for the earning power of farming. It has been a fault with farmers, perhaps, that they have considered the changes in farm values to be merely temporary, and they have therefore been free to contract debts, hoping that the status would quickly regain itself. The fact seems to be, however, that the decline in farm values is general and relatively permanent. The reaction to former land values will come about slowly as the result of improved farming and the general rise in the tone of country living.

In the increasing complexities of our civilization it is impossible that taxation shall fall equitably on all classes of our population. It is probable that the farmer is taxed relatively too high. His property is tangible and visible. Yet the increment of what may be considered as excessive taxation is so small as compared with the earning power of his investment that it can scarcely be regarded as contributing in any large degree to an agricultural decline.

Theoretically, cooperative selling and buying may be the ideal plan for the farmer. It is practically impossible, however, to obliterate middle dealing, for it is only in exceptional cases that the farmer can come into direct contact with the consumer. As already explained, thoroughgoing and complete cooperation among farmers is almost impossible because of the many practical obstacles in the way. In regions in which one kind of product is chiefly grown there may be pooling and centralizing of interests, but even in these cases the pools are usually of relatively short life. In most classes of agricultural produce the price obtained by the pool is that of the average or poorest product rather than of the best. There is a general tendency, therefore, for those parties who produce a superior product to withdraw from the pool and to find a personal customer. Perhaps the best instances of profitable and sustained cooperation among farmers are those afforded by creameries. In this case the cooperative interest is aided by the fact that a manufactured product of more or less uniformity is made; the value of the raw material supplied by different patrons can be graded on a decimal system, by means of the proportion of fat in the milk, and the product is staple in the market and relatively imperishable. It is a manufacturing rather than an agricultural enterprise. The business of farming stands for individualism. Each man works and plans for himself, and usually with relatively little reference to his neighbor. Farmers are isolated. Each man's ideals and products are influenced largely by the conditions under which he lives. It is scarcely to be expected that such centralized organization as obtains in manufacturing pursuits can obtain in the agricultural field.

There are undoubtedly inequalities in transportation charges, but these result in local disturbance and not in a general decline of agriculture. If by cheaper transportation and less middle charges farming is made more profitable, then more men will go into farming and much that is gained may be lost. Nevertheless, difficulties associated with transportation are undoubtedly the cause of agricultural distress in certain regions.

Protective tariff is of less value to farming than to manufacturing, and it may be one reason for the inequality between the two businesses. The farmer deals little in raw materials other than those that he raises, and he has little control of the selling market, since the selling of his products is largely delegated. Primarily he is not a trader. His individual and isolated position give him little leverage on the market. The farmer's surplus, or what he has to sell, is largely perishable and thereby he is again at a disadvantage. He can not hold his product for any great length of time. What benefit the farmer secures from tariff protection is largely indirect. Notwithstanding this, it is difficult to believe that protection can be assigned as a cause of any general agricultural decline, for the farmer has shared in whatever general prosperity the tariff protection may have brought.

Overproduction is often cited as the cause of the agricultural depression. It is easy to figure the proportion of the crop of the staple grains to the consumers and to find that the production is sometimes too great per capita. It is true that there

is often an overproduction in staples, but it is seldom that there is an overproduction in the luxuries and amenities. In the staple products the demand largely determines the supply; whereas in products of luxury the supply, to a large extent, determines the demand. There may be overproduction of wheat in a certain township, but it is very unlikely that there will be an overproduction of apricots or other fancy articles. However, if there is overproduction no statute law can correct it. Similar danger lies in every business. It is temporary and more or less local. It merely shows that too many people are engaged in farming, or that too many farmers are raising one crop. In the long run the question will solve itself by the operation of the natural laws of supply and demand, and the solution will no doubt come the quicker the freer the crop from speculation. The dangers of overproduction threaten every business in which men engage. This danger is, in fact, the very spur to effort and to improvement in order that better and more various products may be secured that will reach new and open markets.

Other economic difficulties which are sometimes ascribed as the cause of the agricultural decline are merely symptoms of changed conditions. Such, for example, is the drift from the country to the city. Fewer people are needed on the farm at the present day because much of the work that was once done by hand labor is now performed by machinery. The movement from country to city is one of many economic movements which are caused by the changing conditions of the times. It can not be understood when standing alone and it is not primarily an agricultural question.

Abandoned farms are only symptoms of a change in rural conditions. Many of the farms that are now abandoned would never have been settled if the easier and more fertile lands of the West were then accessible. It is sometimes said that a New England farmer lives on what he saves rather than on what he earns. The opening of the great West gave new opportunities and presented new ideals. It would have been strange if many of the hill farms of the East had not been abandoned. The general tendency is for these hill farms to be amalgamated into grazing ranges or to be taken as summer homes by city people. All the fertile and accessible lands of the East, however, are still good farming areas, supporting prosperous farmers. Although the abandonment of farms in parts of New York and New England may work hardship on the present generation and cause much uneasiness, it will no doubt be regarded a generation hence as having been a necessary economic change and therefore productive of good results.

The increase of farm mortgages in some parts of the country is frequently cited as an indication of an agricultural decline. It is often the measure of local unthrift, but it can not be considered the cause of a general depression. In great numbers of cases the mortgage represents the purchase money of the farm and therefore is not to be charged to loss. The mortgage, when it does not represent purchase money, is rather an indication of unfortunate local conditions or of poor executive management on the part of the individual farmer than as a fundamental cause of depreciation and unrest.

2. *Poor roads.*—It is true that the American country roads are very poor. This is due in part to the great extent of the country and the large holdings, and in part also to the fact that in many regions the railroads have developed before the wagon roads, and the necessity of road improvement has therefore not been so imperative. In many great geographical regions road-building material is scarce and expensive. Poor roads contribute to the unattractiveness of farm life and therefore complicate the social condition quite as much as the economic condition. It can not be considered, however, that poor roads are the underlying cause of any agricultural decline. If roads need to be improved for the benefit of farming, the problem is in the hands of the farmers themselves; for as soon as they demand that better roads shall be made necessary means will be provided. It is easy, however, to carry the agitation for good roads too far, for the building of roads may entail more expense in many cases than the adjoining property is worth. Much of the agitation for better roads comes from persons who are not farmers. The agitation is bound to bear good fruit and it should be encouraged, but the reform will come slowly and gradually, and thereby it will be the more permanent.

3. *Lack of good farming.*—It is undoubtedly true that the lack of good farming, or the inability of the farmer to appropriate the best knowledge and advice of the time, is the fundamental cause of most of the agricultural unrest. The future must see a greater intensification of effort on the farm. The amount of capital invested in the ordinary farm is very small. Farming is essentially a small business, and the rate of profit, even on poor farms, is nearly always high. It is no unusual thing for a farmer to make a living on a farm which represents an investment of not more than two to four thousand dollars, and in many cases he is able to save a little money beyond his living to add to capital. Cases are not unusual in which a farmer produces an annual profit from a field equal to the entire value of the field itself. There is a tendency for the big farmer to crowd out the small one in certain localities or in particular branches of farming; but, as a rule, the farmer holds his individuality

even though his investment and his base of operations are very limited. Since his expenses are almost necessarily increasing with the new demands of civilization, it is increasingly more important that he shall intensify his methods in order to produce the greatest possible product from a given amount of land.

The farmer usually is not skilled in making money from hired labor. His "hired hands" are often his neighbors; he treats them as equals. He does not like to work men in gangs; he is not an overseer or a boss; hired labor means to him a different thing than it does to the contractor. Yet, notwithstanding all this, the general tendency is to make relatively more of the labor than of the land. This economic difficulty was well expressed by Washington in 1791 in a letter to Arthur Young, and his remarks are equally applicable at the present day: "An English farmer must entertain a contemptible opinion of our husbandry, or a horrid idea of our lands, when he shall be informed that not more than 8 or 10 bushels of wheat is the yield of an acre, but this low produce may be ascribed, and principally, too, to a cause which I do not find touched by either of the gentlemen whose letters are sent to you, namely, that the aim of the farmers in this country (if they can be called farmers) is not to make the most they can from the land, which is, or has been, cheap, but the most of the labour, which is dear. The consequence of which has been much ground has been scratched over and none cultivated or improved as it ought to have been, whereas a farmer in England, where land is dear and labour cheap, finds it his interest to improve and cultivate highly, that he may reap large crops from a small quantity of ground. That the last is the true and the first an erroneous policy I will readily grant, but it requires time to conquer bad habits, and hardly anything short of necessity is able to accomplish it. That necessity is approaching by pretty rapid strides."

Various natural agencies are against the farmer. For example, there is a general tendency toward the depletion of available plant-food in the soil rather than toward its augmentation. Insects and diseases are more numerous and more serious, consequent upon the increased commerce with the world and the danger of introduction of pests, upon the greater variety of crops, upon the greater extent of crops of one kind, upon the fact that the natural breeding places of these pests in woods and fields are being eliminated. On the other hand, the farmer has more resources to-day than he had a generation ago. A large part of the work of the experiment stations thus far has been directed toward the overcoming of natural difficulties. In most cases the farmer has a recourse for the destruction of pests and the overcoming of environmental obstacles.

If poor farming is really a fundamental reason why farming does not take its place alongside many other callings it is plain that the only fundamental remedy therefor is education. Never has there been so much intelligent and scientific attention given to agricultural questions as now, and there is no country in which so much has been done to educate and to help the actual farmer as in North America. This effort has been productive of the greatest good, and the general tone of farming has raised immensely within a generation. Many of the questions that farmers discuss to-day were wholly unknown to them a generation ago. Farmers' meetings are well attended and the discussions are clear-cut, practical, and pointed. Anyone who is familiar with the present attitude of farmers will have no doubt of the future. Present-day farming is full of vim and vitality, and it is constantly improving.

4. *Social conditions.*—The so-called agricultural question is only in part an economic one. It is largely social, intellectual, and spiritual. We have erred in putting the stress on the economic or commercial side of the problem. Half the value of farm life is in the satisfaction of living it. The attractive side of farm life must be emphasized. The farmer's mind must be open to appreciate things that are his without the asking or the buying. Ordinarily the city man appreciates the advantages of farm life more than the farmer does. He desires to go to the country to escape the city. This desire is in part an expression of natural unrest. The city man longs for the country, and the country man longs for the city. However, the city man usually has a more specific knowledge of what the country is and what it can give him than the country man has of the city. In the country the individualistic life is possible. The advantages that the country man has are far beyond the power of money to buy. When the city man wants strawberries he goes to his pocket; when the country man wants them he goes to his garden.

The following letter from a staff man on one of our metropolitan dailies indicates the point of view of many a city man toward the country and it is one which the country man himself too often fails to appreciate: "My reading and investigation have crystallized my longing for a return to the farm life of my boyhood days. For several years I have been laboring in police courts and in doing such work as ordinarily falls to the lot of a staff man on a large metropolitan newspaper. I am asking for the experience of others as a guide against the day that I am able to drop newspaper work for the harder labor of being my own boss on a bit of farm land

somewhere. I have a profound love for everything that a city lacks and which the green fields, the sunny skies, the falling rain, and the vistas of growing things only can afford; and I have no preference for North or East, or South or West, so long as it carries me away from city life with its ninety-nine parts of misery to one part of happiness." It is difficult to place a tangible value on such an appreciation as this, but it is nevertheless one of the legitimate assets of the farm.

Those who are familiar with the literature of country life will have been struck with the great importance that is given to this intellectual and spiritual side as contrasted with the mere economics of farming. The value of open fields, running brooks, and green trees is quite beyond the reach of mathematical calculation. The following extract from Horace Greley, who knew both the city and the country point of view, is interesting in this connection: "If I were asked to say what single aspect of our economic condition most strikingly and favorably distinguished the people of our Northern States from those of most, if not all, countries which I have traversed, I would point at once to the fruit trees which so generally diversify every little, as well as larger, farm throughout these States, and are quite commonly found even on the petty holdings of the poorer mechanics and workmen in every village and in the suburbs and outskirts of every city. I can recall nothing like it abroad, save in 2 or 3 of the least mountainous and most fertile districts of northern Switzerland. Italy has some approach to it in the venerable olive trees which surround or flank many, perhaps most, of her farmhouses, upholding grapevines as ancient and nearly as large as themselves; but the average New England or Middle State homestead, with its ample apple orchard and its cluster of pear, cherry, and plum trees surrounding its house and dotting or belting its garden, has an air of comfort and modest thrift which I have nowhere else seen fairly equaled."

Contrasted with these spiritual and intellectual aspects of country life is the relative isolation of the farmer. His social ostracism is rapidly disappearing, however, under the influence of trolley roads, neighborhood telephones, rural-mail delivery, bicycles, and better roads. These agencies also bring the city man into the country and thereby add greatly to the momentum of these civilizing movements. They will undoubtedly do much to keep the future generations on the farms.

The desire to leave the farm is no doubt crystallized in most people's minds before they have come to the age to appreciate the economic advantages or disadvantages of farming. They are influenced largely by the unattractiveness of the farm home, by the lack of opportunities for social pleasures and for physical comfort. The farm buildings and appurtenances are not tasty nor attractive nor convenient; they repel rather than attract. The lack of ordinary means of sanitation is too often apparent. Frequently the boy is given no chance to develop himself. What was Tom's calf becomes the old man's cow. The boy compares his estate with that of the city boy's; his dissatisfaction crystallizes into desertion of the farm. Much of the dissatisfaction with farm living is due to the hard lot of the woman. The condition of women on the farm is a fairly good index of the intellectual and social status of the community. The condition of the farmer's wife may not be expected to improve merely because the economic status of the farmer appreciates; it will improve only as a higher type of living, quite independent of income, comes into existence.

In the long run the best survive. This rule holds in farming as well as in manufacturing or in the professions. It may be hard on the individual, but it finally works out the good of the race or of the vocation. It is really surprising what a small percentage of the persons engaged in any calling really achieve what may be fairly called success. The farmer is likely to compare the agricultural status with isolated successes in other callings, but if he were to make a careful investigation he would find that the proportion of successful men in farming is as great as in other callings, and probably even greater. The following extract from a recent volume of the *International Medical Magazine* will illustrate the point: "Of the nearly 2,500 physicians in Paris, says the *Pacific Medical Journal*, 5 or 6 make from \$40,000 to \$50,000 a year; 10 to 15 make from \$20,000 to \$30,000; 100 make \$3,000 to \$5,000; 800 make from \$1,500 to \$3,000, while 1,200 make less than \$1,500."

The sentiments of Washington respecting country life are worthy of emulation. The man who had all the opportunities of his day and who led the American armies to victory, wrote as follows to Arthur Young in the closing year of his life: "The more I am acquainted with agricultural affairs the better I am pleased with them, inasmuch that I can nowhere find so great satisfaction as in those innocent and useful pursuits. In indulging these feelings I am led to reflect how much more delightful to an undebauched mind is the task of making improvements on the earth than all the vainglory which can be acquired from ravaging it by the most uninterrupted career of conquests."

BUFFALO, N. Y., May 27, 1901.

STATEMENT OF MR. SPENCER KELLOGG,

Proprietor of the Kellogg elevator, Buffalo, N. Y.

The Western Elevating Association has been organized for a good many years. The only thing that has any interest to me at the present time is that they have made an agreement with the trunk lines to elevate their grain, and they in turn have agreed to pay them one-half cent a bushel on all grain that passes through this port and is shipped by rail.

Q. (By Mr. West.) Who agrees to pay that?—A. The trunk lines, composed of the New York Central, the West Shore, the Delaware, Lackawanna and Western, Lehigh Valley, and Erie; those are the trunk lines running east to New York; they are under one management, I believe, now. Harriot, of the Erie, has the making of these rates. If you want a rate you must go to Harriot for it. If any grain man wants a rate through the Kellogg elevator they give him a half cent higher rate for freight, because they claim that inasmuch as they have made this contract to pay a half cent, if they paid the Kellogg a half cent they would be paying double elevation; that is their side of the story—the railroad's side; while I claim that it is boycotting the Kellogg elevator, because nobody is going to ship through the Kellogg elevator and give them half a cent for the privilege of doing so; and that is the reason they have for making that agreement, I believe. That we of course expect to prove. Up to this time last year we had elevated about 2,000,000 bushels of grain, and then the boycott took effect and we didn't elevate any. This year it has been continued, and we have practically elevated no grain at all. Of course, that only shows that the boycott has taken effect. The Kellogg elevator is out of the race. The only grain they have any chance of getting at all is the canal grain, and the Western Elevating Association, to handicap the Kellogg elevator, I believe is elevating that grain free; so the Kellogg elevator can neither get rail grain nor canal grain. I don't know what arrangements they have with these forwarders, but we can't make inducements sufficient to get the grain. That is about the way we look at the matter. It is simply a boycott; that is all there is about it, and we have been willing and are willing to-day to elevate for just half the price they are charging. We think there is money in it at that, at one-quarter of a cent a bushel, but there must be a certain amount of business to make it pay at that rate.

Q. How long has this boycott been in effect?—A. Since about the 1st of June last, 1900. We are going to try and see if they can do that sort of thing in this country.

Q. The case is now in the courts?—A. Yes.

If this arrangement had been made at the first of the season, I do not think it would have been legal, but it would have had a better appearance; but this contract was made after they had attempted several times to get the Kellogg elevator into the association and the Kellogg elevator had refused to go in; refused to be dictated to; so after that they started to put on the screws.

Q. How long has canal grain been elevated free of charge?—A. Well, since we started competing for it last June; and one year—year before last, two years ago—when all the elevators were out, when there was no association at all—all the elevators were outside competing for the grain. I have always contended that this grain should be competed for the same as any other grain.

Q. That is, by competing elevators?—A. Yes; the same as any other business.

Q. What is the effect of this combination upon the farmers and upon the public generally?—A. Why, I presume the effect, while it would aggregate a large amount, wouldn't be felt; just like a tax spread over a whole community, nobody realizes what it is.

Q. In this case the tax is in the form of higher charges than would otherwise be charged?—A. In the elevating business, certainly the rates are higher now than they would be under competition.

Q. Have the rates been raised?—A. No; 3 or 4 years ago they were lowered from three-fourths to a half.

Q. Prior to June of last year was there no pool or combination among the elevators?—A. There had been a pool for a good many years.

Q. But no boycott upon the outsiders?—A. No boycott, because they never succeeded in getting the railroads to pool with the association. This last year they were in good condition to form such an arrangement, because the railroads were pooling themselves, and the Western Elevating Association succeeded in making them believe that unless they had an association it would cause friction in their rates

by the cutting of rates, which was not a fact, because shortly after that they did cut the rates for about a couple of months, until they got together again.

Q. Just what is the relation between the railroads and the elevators in Buffalo?—A. Why, that is the only relation—this agreement—that I know of.

Q. By whom are the elevators owned?—A. The New York Central have their own elevators, also the Erie; the Lehigh Valley and the Delaware, Lackawanna and Western have not their own elevators; the latter, however, has a small elevator called the Union, which is not of much account. I guess they don't figure on that being any factor. The West Shore, of course, is leased by the New York Central; as a railroad they have no elevator.

Q. Is the competition of the Erie Canal effective in the grain business?—A. I think not now; you might say not positively. I am positive about that, because last year I think they carried 15,000,000 bushels, and I don't think they will carry that this year, out of upward of 150,000,000.

Q. These figures you have given are for the grain going from Buffalo to New York City?—A. Yes, sir; also to other eastern seaports.

Q. Can you suggest any legislation, national or State, to remedy the abuses you speak of?—A. Well, I must say I have not a great deal of faith in legislation. I don't want to be put down as a pessimist, but when I look at the Interstate Commerce Commission I will say that I don't believe there is any use of any other legislation, unless it is to give that commission more power.

Q. In what way would you have the commission's power enlarged?—A. I couldn't say, because I am not well enough posted on that line.

Q. Does this elevator pool affect the price of wheat?—A. These little charges of an eighth and a quarter, while they do affect, and you can figure them up in so many hundreds of thousands of dollars, they are spread over so much territory that people don't feel it—just like a stamp on a check or any other tax.

Q. Do the Buffalo elevator men deal in grain on the board of trade?—A. They deal but very little.

Q. Is there any law in New York State prohibiting public warehousemen from dealing in grain?—A. Not any.

BUFFALO, N. Y., May 27, 1901.

STATEMENT OF MR. WILLIAM H. KNAPP,

Of the firm of Lucas & Co., canal forwarders, Buffalo, N. Y.

Q. (By Mr. West.) Does the elevator pool, so called, interfere with your business?—A. Yes; it makes it very much nicer, because on all the stuff that comes through the elevator pool we get free elevation, and they charge the railroad half a cent, because we have to bid half a cent under the railroad in order to do any business on the canal, and that is why that is done, and the elevator pool favors us in that respect. If we had to pay half a cent elevation, our freights would necessarily be 1 cent lower than the railroad freights and we couldn't compete with them at all.

Q. As it is you are able to charge—A. We charge half a cent under.

Q. Is it chiefly export grain that is shipped by canal?—A. In a great many instances it is, and we have had a lot of grain here that has been for home consumption.

Q. Is there any difference in the rates to New York between export grain and grain for home consumption?—A. Not a particle; it is all the same.

Q. Does that apply both to the railroads and the canal?—A. That I don't know; it does as to the canals.

Q. Are there any elevator companies which do business over the canals only?—A. There was one last year, but none this year. The Watson can't do any business except canal business, because it is on an island.

Q. Do the elevator men in Buffalo deal in grain on the board of trade?—A. There is no dealing here in Buffalo. You mean options? There is no dealing in Buffalo except by men that have made a business of that.

Q. In other words, the dealing on the board of trade here is entirely bona fide business?—A. Oh, sure. If there is an option bought or sold it has to be sent to Chicago or New York.

Q. Do none of the elevator men deal on the board of trade or through brokers?—A. I don't know, but I don't think they do. That is something I don't know about. The elevators are mostly owned by corporations—in fact, they all are. There is no private individual that owns an elevator here except Thomas M. Ryan, and his hasn't loaded a boat in 5 years. The other elevators are owned by corporations.

- Q. So there is now no canal elevator doing business?—A. No.
- Q. There are elevators which do both a rail and canal business?—A. All of them, except those that can't do rail business. The all-canal elevators aren't doing business.
- Q. The railroads have driven the canal elevators out of business?—A. The all-canal elevators, because the railroads here own the majority of the elevators.
- Q. Do the railroads own all the elevators that are now doing business in Buffalo?—A. Not all of them.
- Q. About what proportion of the storage capacity of Buffalo is controlled by the railroads?—A. Half of it. That is, of course, a guess; but I should say half.

BUFFALO, N. Y., May 27, 1901.

STATEMENT OF MR. P. G. COOK,

Secretary of the Western Elevating Association.

- Q. (By Mr. WEST.) Will you tell the commission about the Western Elevating Association and its purposes, etc.?—A. The association is formed for the purpose of facilitating the business of the people doing business here. It centralizes the work and establishes a uniform price for elevating grain and for storing also.
- Q. When was this association formed?—A. It is formed from year to year; it runs from year to year. The usual date is from the 1st of April to the 1st of April.
- Q. When was it first organized?—A. Way back in the sixties somewhere. Of course there have been seasons when all or a part of the year there wouldn't be any association, but as a rule it has run since that.
- Q. Is there any pool among the elevators?—A. This association provides for the collection and distribution of the earnings on the basis of shares or percentage.
- Q. Would you be willing to explain a little more fully how that is done?—A. They simply agree that the earnings from elevation and storage shall be collected by the treasurer of the association, and, after deducting the expenses of this office, shall be paid out again to the various elevators in the association according to the percentage or shares that they have in it.
- Q. Shares of stock?—A. There is no stock. It is simply an agreement with them that they are to have such proportion of the net earnings.
- Q. May I ask upon what basis the earnings are divided, whether upon storage capacity or some other basis?—A. Hardly the storage capacity. Of course the storage capacity does enter into it, it is an element in it; and then another thing is the working capacity of the house; and, in a measure, the business controlled has something to do with it.
- Q. What is the distinction between the storage capacity and the working capacity?—A. Some have 1 elevator leg and others have 2 and some have 3. Of course a house with 2 can elevate more and handle more than a house with 1.
- Q. So that there is no one basis?—A. No, sir.
- Q. It is a matter of agreement?—A. It is a matter of mutual agreement anyway.
- Q. What is the effect of the association upon the elevators not in the association?—A. That is a pretty hard question. They simply have to go into the market and take business on their own hook.
- Q. Can they get business?—A. Yes.
- Q. Can you state what proportion of the elevator business in Buffalo is done by elevators in the association?—A. I think about 95 per cent of it, last year.
- Q. For the calendar year?—A. For from April to April.
- Q. For from April, 1900, to April, 1901?—A. Yes. We handled very close to 150 millions out of 155 millions and a fraction.
- Q. What have you to say to the allegation that the association boycotts outside elevators?—A. We don't boycott anything. We aren't in shape to boycott anything. We are simply here in shape to handle business coming down the lake. If anybody wants to work with us to-day and work with somebody else to-morrow, that is his privilege. We don't boycott anybody.
- Q. Are the charges for elevating and storing grain the same in the association as in the outside elevators?—A. I don't believe I could tell you that. Our rate is published. Of course an outside elevator might cut—very likely would cut to get business.
- Q. Will you kindly state your charges?—A. One-half cent a bushel for elevating and including 10 days' storage; and for storage after the first 10 days it is a quarter of a cent for each 10 days or any part thereof; and on through-rail grain there is no charge for loading in addition to the elevation rate; but on local, near-by grain, which

is practically grain peddled from here, there is a charge of one-eighth of a cent for loading in addition to the other. That usually goes out in small quantities, while the other goes in large quantities.

Q. Was there danger of cutting in the charges for elevation and storage before the association was formed?—A. Yes, sir.

Q. And the prevention of that was one of the objects of the association?—A. Yes, sir.

Q. Would you be willing to state what the other objects are?—A. Well, one great object is to maintain a uniform rate and another is to centralize the business and to give responsibility to the receipts—that is, the bank will take our receipt without any question, while there are numbers of individual elevators that they wouldn't take without they had bondsmen; and everyone handling business here comes right to this office and transacts it here, whereas if there were 20 different offices to transact business they would have to go around to the different offices to handle it.

Q. How many elevators are there in Buffalo not connected with the association?—A. I couldn't tell you without counting them up.

Q. A large number?—A. Quite a few. They are not operating.

Q. None of them operating?—A. The Kellogg is operating. I think that is the only one at present.

Q. Has the association driven the others out of business by competition?—A. Oh, not necessarily. A good many of them haven't worked for years, whether they were in the association or out of it. The elevators in the association, as at present constituted, all have a connection with a railroad; that is, they have tracks to their elevator by means of which grain can be shipped on a railroad as well as by canal, and, with the exception of the Kellogg, all the elevators not in the association are houses that do not have any track connection, and consequently can handle nothing but canal business, and they can't make a go on that business alone.

Q. Would you be willing to explain more fully just what the connection between the railroads and the elevators is?—A. They haven't any very great connection with them, except they handle business for them the same as for other people. Some of the elevators in the association are owned or controlled in some way by railroads, and they have an agreement to handle railroad grain at the price stipulated on the card—half a cent a bushel.

Q. How many elevators are there in the association altogether?—A. Twenty-one or 22.

Q. Do you hear any complaints of excessive charges for transfer, elevation, or storage of grain?—A. No, sir. Not at the rate we are running at now.

Q. Is that rate lower than formerly?—A. Yes. It used to be seven-eighths of a cent.

Q. And was that rate complained of as excessive?—A. Occasionally.

Q. Does the publication of these rates do away with any advantages which elevators might otherwise have in dealing in grain?—A. Oh, yes. As I look at it, it puts everyone on an even footing in handling grain or in putting grain through here. The charge is always collected just the same whether they own grain or do not. Elevators in the association do a strictly warehousing business.

Q. Even the owner of an elevator would have to pay storage charges if his elevator were in the association?—A. Certainly.

Q. Are there any suggestions that you would care to make as regards National or State legislation affecting the transportation of grain or storage of grain?—A. No. From my observation, and I have been in the business a good while, legislation as a rule doesn't benefit the business at all in that line. I think the trade will take care of itself down this way. You can't charge an excessive rate here for doing business without drawing other people into it, and a uniform rate here as established by the association is of very great advantage to the trade generally, for the reason that any man doing business knows he is getting just as good a rate as his neighbor, whereas if there is no association, you have got to dick around all around and then not get as good as the next, perhaps. It facilitates trade in every way. You take it now, we can send grain going by rail to any house that has a connection with the road that is to carry the grain. In case there were no association, the grain would be forced practically to one or two houses under the influence of that road, causing congestion and delay at such elevators.

Q. Do the elevators which are controlled by railroads have any advantage over other elevators by reason of that fact—over elevators outside of the association?—A. Why, just how do you mean?

Q. In the case of the Chicago elevators it was testified that their connection with the railroads gave them certain advantages.—A. Why, I should say no, not here. Of course, where that might have an effect would be in the formation of an association, that they would get a better rating through having control of that business;

but the minute it is formed, if there comes a rush, the grain is sent wherever it can be handled to the best advantage.

Q. Does the association prevent the railroads from granting a monopoly of the grain business on their respective roads to any particular elevator?—A. No; we don't have much to say about that.

Q. Doesn't this division of the receipts have that effect?—A. It does have that effect, as it is understood that all the means at the command of the association shall be used when necessary to facilitate the handling of grain; and, as a result, an excessive amount of grain for shipment over one road would be distributed to several elevators to prevent delay.

Q. Would you be willing to give the commission a copy of the agreement?—A. I hardly like to, because that is a sort of a private paper.

Q. You have stated, I suppose, the gist of it?—A. Yes, sir. I will let you look it over if you want to see it.

Q. What is the arrangement about winter storage?—A. It is provided that the winter storage, after December 1, shall belong to the elevator storing it. Now, that refers simply to the extra storage and not to the half-cent elevation. The extra storage during the winter doesn't run a quarter of a cent every 10 days all winter long, but only until the accumulation after the 1st of December amounts to 2 cents.

Q. The maximum charge is 2½ cents?—A. For elevating and storage.

(The company's rate card, submitted by Mr. Cook, is reproduced below:)

THE WESTERN ELEVATING ASSOCIATION AND GEORGE F. SOWERBY COMPANY,
OF BUFFALO.

Rates for elevating and storage on all sound grain received on and after date. Until further notice, the charge for elevating and storage will be as follows: For elevating (including 10 days' storage), per bushel, one-half cent; for storing, each succeeding 10 days or parts thereof, per bushel, one-quarter cent.

All accrued elevating and storage on grain remaining in store on April 1 in each year must be paid to that date, on or before 10 days after the opening of canal navigation following, under penalty of one-half cent per bushel additional storage, if not so paid on that date.

Above charge to be paid by the grain.

BUFFALO, May 15, 1901.

WASHINGTON, D. C., June 10, 1901.

TESTIMONY OF MR. J. H. RALSTON.

Attorney at law, Washington, D. C.

The commission met at 10.55 a. m., Mr. Phillips presiding. At that time Mr. J. H. Ralston was introduced as a witness, and, being first duly sworn, testified as follows:

Mr. KENNEDY. Please give your name and address and occupation.

The WITNESS. Jackson H. Ralston; Bond Building, Washington, D. C.; attorney at law.

Mr. KENNEDY. Mr. Chairman, I think Mr. Ralston would prefer to say what he has to say on the single-tax question without interruption, and then submit to any questioning at the end.

The WITNESS. If that is agreeable to the commission, I will make a statement, and then submit myself to such questions as the commission may see fit to ask.

I presume in entering into a discussion of this sort I ought in the beginning to define what I understand by the single tax. I understand it to be a system of taxation which calls for the levying of all taxes on the value of land, exclusive of the improvements borne upon the land. When carried to its logical ultimate, it would involve the doing away with all tariff taxes, and with all license taxes, with a possible exception in so far as license taxes are imposed for police reasons; the abolition of all taxes on personal property and of taxes upon the improvements upon land; leaving as the sole subject of taxation the value of land itself, the one thing which is not the direct result of labor, and which is rather the incidental result flowing from the advancement of the community, from the perfection of government, from the educational and other advances incidental to the community, transportation facilities, and any of the elements that would naturally conspire to maintain or increase the value of land.

Historically, I might perhaps say a word. There has, in the judgment of single taxers at least, been a constant groping toward the single tax for several hundred

years. Prior to the century just past the most pronounced steps in that line were taken by the French philosophers of the time of Louis XIV, Louis XV, and Louis XVI. The single taxers are fond of citing the example of Quesnay, Turgot and Dupont de Nemours, and others of the prominent Frenchmen of about 250 years ago, as giving indications of a belief in the principles of the system which has now become elaborated under the name of the single tax. Turgot, as will be recalled, was the French minister who attempted a reform of the system of taxation in France, and who attempted to reform it in the line of the single tax. But the vested interests of France at that time were too strong for the reforms attempted by him, and he ultimately lost his ministry; and after the downfall of the sort of reform advocated by him ensued the French Revolution.

There were, later on, some English writers who indicated a knowledge of the general principles which we now group under the name of the single tax. Among them was a man by the name of Spencer, who wrote over 100 years ago. Later on was a man by the name of Dove, who wrote about 1840. But the general theory was more successfully, more logically, and more completely elaborated, as we know, by Mr. Henry George.

Mr. George himself did not claim to be the originator of the system; in fact, in his writings he recognizes the justice of the criticism of some one who says that whatever there is in his writings that is new is bad and whatever there is that is good is old. Of course, with Henry George's ideas that is precisely so, and the underlying ideas of his system are to be found long anterior to him. He simply assembled, grouped them, and gave them a form and substance, and clothed them in a style of unsurpassed literary excellence.

The authorities referred to by Mr. Henry George in the course of his argument are authorities whose force is generally recognized—Adam Smith, author of the *Wealth of Nations*, John Stuart Mill, and Herbert Spencer; the underlying idea of the single tax being well stated by Herbert Spencer in one chapter in his *Social Statics*, a chapter the logic of which can not be escaped, although in later years under different surroundings and under different circumstances Spencer attempted to repudiate his own logic.

The present movement toward the single tax may therefore be dated from the time of the publication of *Progress and Poverty* by Henry George—from about 1879. The book was looked upon at the time of its publication as remarkable. Its literary style was recognized. Its force of argument was recognized. But it was not regarded then as having any serious practical importance, and the ideas only sprang into public notoriety upon the campaign of Henry George for the mayoralty of New York in 1886. There have been from time to time other events of a more or less striking nature which have brought the single tax into prominence, one of the most striking being his second candidacy for the mayoralty in 1897.

It might perhaps be of importance or interest, before commencing a discussion of the reasons for which the single tax is advocated, to consider whether it has attracted the attention of a sufficient number of men of intelligence and thought to justify spending any particular time with regard to it, and whether it has to any extent made any impress upon public thought up to this time.

If I refer to the events in Congress as bearing upon this question, I should direct your attention perhaps, as first in order of time, to the investigations made by a subcommittee, I think, of the Committee on the District of Columbia, under the supervision of Mr. Tom L. Johnson, when he was in Congress about the year 1891. Many witnesses were called before that subcommittee, the object of the committee being to report to Congress as to whether the single tax would be advisable as a system to be put into effect in the District of Columbia. The report of that committee was in favor of the adoption of a system of that kind, the report being verified by an abundance of tables well worthy of very careful examination.

The next Congressional event of note would be in connection with the Wilson bill before Congress, a proposition for the purpose of raising some \$20,000,000 or so to supplement the amounts of money receivable from import duties. Judge Maguire introduced an amendment to the bill providing for a system of taxation on land values throughout the United States, excluding, of course, improvements and personal property; and his amendment received the votes of such men as Mr. Harter, of Ohio, whose ability was unquestioned; of Mr. Tracy, from Albany, N. Y.; John De Witt Warner, from New York City; Jerry Simpson, if I am correct, from Kansas; Judge James G. Maguire, of California; and possibly one or two others whose names I will slip me. Of course the proposition was defeated; the time had not arrived for it.

At the last session of Congress a bill was introduced providing for a gradual adoption of the single tax in the District of Columbia, this bill being introduced by Mr. Ridgely, of Kansas. It was referred to the Committee on the District of Columbia of the House, and nothing came of it, although it received the sanction of the labor organizations of the District of Columbia.

It may not be out of place for me to say that the single-tax system of taxation has received the very general sanction of labor organizations throughout the country.

The declaration of principles of the Knights of Labor recognizes the single tax as something to be worked for. It is one of the principles of the Knights of Labor. The American Federation of Labor has by repeated resolutions, passed at annual meetings, favored the adoption of the single tax. Of course the labor organizations in New York, by the indorsement of Henry George, practically gave their indorsement in two different campaigns to the thing for which he stood, not merely inferentially, but actually. Other labor organizations have repeatedly passed resolutions in this same general direction. I think that it may be said that among labor organizations throughout this country it is impossible to find any opposition to the single tax, except it be on the part of individuals who have not studied the question or who may be perhaps biased by their more immediate, as they consider, personal interests.

We may therefore say truly, I think, that the largest share of support which the single tax has received among thinking men—among representative thinking men—in this country has been among the labor organizations.

The subject has found its way into the magazines. There is perhaps not a magazine of prominence in the country which has not at some time or other in the course of its career published articles favorable to the single tax. I might mention notably the debate of years ago between Henry George and Mr. Atkinson appearing in the columns of the *Century*. The *Arena* has been particularly notable for the number of articles which it has published in the same general line.

The single tax is finding its way into legislation. Some 3 years ago an amendment to the constitution of the State of Washington passed the legislature of that State for submission to the people, the purpose of that amendment being to permit local bodies to say if they wished the single-tax system of taxation for their local purposes. That amendment, while not necessarily a single-tax proposition, was so treated by the people and press of the State of Washington; and, while it was defeated, it is to be noted that it received a very heavy vote at the election.

At the last session of the legislature of Colorado a somewhat similar proposed amendment to the constitution was adopted for submission to the people, the vote of adoption being perhaps 4 or 5 to 1 in favor of the amendment. And I am informed by Senator Bucklin, of Colorado—the author of the amendment—that he confidently anticipates that the people of Colorado will give that amendment their favorable vote at the election in 1902. The proposition will have to be submitted in 1902.

The single tax has received more discussion in the State of Delaware than in any other State in the Union, the immediate effect of that discussion being that at the last session of the legislature an amendment providing for what we might term home rule in taxation, which would permit any town to adopt the single tax if it saw fit, passed the lower house of the legislature and by pure accident was defeated in the senate by about 1 majority, one man misunderstanding what he was voting for, although he had intended to vote favorably, and a second advocate of the proposition being out of the senate for a moment.

In several other legislatures of the United States at recent sessions propositions in the same general line have been submitted and have come near adoption. This was true in the State of Texas and was also true in the State of New York. A similar proposition was lost in the State of Michigan about 2 years ago by 1 vote in the house after having passed the senate.

I mention these things as showing that, although there has not been of late any occurrence in connection with the single-tax discussion that might be termed sensational in its nature, nevertheless the discussion and the movement are going on hand in hand, and going on rapidly.

Some gentlemen, whom perhaps I ought not to quote by name, but whose positions have been such that they have been placed in touch with public sentiment all over the United States, have taken occasion to say to me that the single tax was proceeding at the present time with greater rapidity than at any prior time. From the view of the single taxer all this is natural. It appeals, as we believe, to educated political sentiment. This sentiment finds its outlet in public bodies such as Congress and the legislatures, in the magazines, and the newspapers. I venture to say even the members of this commission would be surprised if they could be truly informed of the very large percentage of newspaper men who are open and avowed single taxers. It is true that the proportion of newspaper men of this way of thinking does not yet find its illustration in the editorial columns of the press; for, as we know, the editorial columns of the papers are very largely controlled by the business office, and business interests are not yet sufficiently educated on this subject to realize the fact that their best development is to be found in the line of the single tax.

But, perhaps, speaking of the reasons why the single taxers advocate their particular theory, it might be of interest to point to some practical illustrations bearing upon it. It is a matter, perhaps, of curious, although not of important, interest to

know that the very first development of the single tax occurred in this country long before the name was known. Some 60 years ago in the town of Alton, Ill., a resolution passed the common council providing that all taxes should be levied upon the value of the land, and that improvements and personal property should be exempt from taxation. I mention this fact as being something entirely unknown or practically unknown at the present time. It has been lost sight of in all the recent discussions, and only perhaps had a momentary importance.

Q. Was that law enforced?—A. It was enforced for about a year, possibly two years. The only way I have of knowing that it ever existed is through one of the very earliest of the Illinois Reports, which contains a case from the town of Alton arising upon a question as to the validity of a tax deed, and coming up in this way: The constitution of Illinois provided that all property should be taxed, and the question arose as to whether the town of Alton had violated the constitution in this exemption provision, the question arising upon a tax deed. The holders of the property claimed the tax deed to be void because all property had not been taxed. The question came up before the supreme court of the State of Illinois, and the supreme court so decided, holding that Alton had no right to indulge in the exemptions under the peculiar provisions of the constitution of that State.

Q. (By Mr. LITCHMAN.) The effect of the decision being against the single tax?—A. Against the single tax, yes. And it is quite curious to know that in the discussion there by the court or by the attorneys in that case, the arguments in favor of the single tax were substantially the same as those now stated by the single taxers. That is, approaching the question from what we single taxers sometimes term the fiscal side, it was agreed by all parties concerned that a system of taxation of that sort might prove very beneficial to industry, might tend to the building up of houses, and might do away with the holding of land out of use for speculation to the detriment of the community.

The next illustration that I know of in this country is one in which I was quite actively concerned myself, and which may be fairly regarded as the outgrowth of the present single-tax discussion. It was in the neighboring town of Hyattsville, Md. In that town in 1892 the board of commissioners determined to exempt improvements from taxation, personal property having been theretofore exempted. We believed that we had power so to do under the provisions of our town charter, and we believed also that the provisions of the State constitution upon the subject of taxation were not intended to apply to town taxes. We therefore eliminated the side of our tax book representing improvements, increased our tax rate sufficiently to cover the reduction which might otherwise have occurred because of striking out that part of our tax roll, and levied our taxes under the single-tax system, and collected them for one year. Some citizens of the town antagonized us very decidedly and appealed to the courts. In the circuit court our action was sustained, but the court of appeals held that we were not authorized under our charter to make the exemption we had made, and that our action was unconstitutional. It is perhaps worthy of note that since then the court of appeals has held that no provision of the State constitution has any reference whatever to town government except in certain cases in the city of Baltimore, and if the court of appeals were to-day to follow logically this decision, it would be compelled on this point to reverse its decision in the Hyattsville case.

Since that time the single tax has not been attempted, largely, perhaps altogether, because of constitutional difficulties in this country. But it has gone forward with rapidly increasing strides at the other end of the world.

In New Zealand a very considerable proportion of the colonial taxes are obtained by a tax on the value of lands exclusive of improvement. The colonial-tax system in this particular respect has the peculiarity that with the increase in the value of the land there is a corresponding increase in the amount of tax, the effect being, of course, to break up quickly the very large holdings of land that have heretofore existed in New Zealand. In addition, there are probably two or three dozen towns of New Zealand, or local taxing districts, which have adopted the single-tax system for their local purposes. It is worthy of note that no town or taxing district which has adopted the single tax in New Zealand has gone back to the old method of taxation, but, on the contrary, adjoining towns which have seen the benefit of that sort of taxation, have adopted the single tax, one after the other, and by majorities that in some cases are simply marvelous, the votes of the towns running as high as 8 and 10 to 1 in favor of the adoption of the single-tax system of taxation for local purposes.

The facts to which I am now adverting are given, many of them at least, at great length and with much greater particularity than it is possible at the moment for me to give them, or than you would care to have me do, in the report of State Senator J. W. Bucklin to the Colorado State senate, submitted at its last session.

I might say that Senator Bucklin, with 2 fellow-senators, was appointed 2 years ago by the senate as a committee to investigate the Australian land-value system of taxation, and in consequence of such appointment Senator Bucklin went to New

Zealand and to Australia and made a thorough investigation, came back, and, with his fellow-members, submitted a report in favor of permitting the citizens of Colorado to do the very same thing. And it was in consequence of that report that the constitutional amendment of which I spoke some time ago passed the legislature of Colorado for submission to the people of that State.

Q. (By Mr. LITCHMAN.) Will you go a step further and say what the result was of that submission?—A. I can not do that. It is to be submitted in 1902, but, as I said, Senator Bucklin writes me that he anticipates a favorable result.

Let us turn now to the question of why single-tax people believe the single tax should be adopted. We sometimes think that the reverse question should be asked, Why anything except the value of land should be taxed? But we recognize the fact that as we propose what is comparatively an innovation, the burden of the argument rests upon us.

A tax upon the value of improvements is a direct deterrent to the making of improvements, and if it be a good thing that improvements be made, then we should avoid, logically, doing the thing which prevents in any degree their being made. Now, I say that the taxation of improvements deters their erection. I think the proposition is so self-evident as not to require any particular argument. We might almost regard it as axiomatic, whether we be single taxers or not. But one or two illustrations may not be out of place.

We know that at the present time there exists in France a tax on windows and doors, and those of us who have had occasion to investigate it know that the direct effect of that tax has been to prevent the using of doors and windows, even at the expense of health. We know that in England formerly there was a tax on fireplaces, and that the effect was to prevent the erection of fireplaces, and thereby to interfere with the health of the people keeping house.

Mr. FARQUHAR. And also on windows.

The WITNESS. And also on windows, with a like effect. To use a very homely and common illustration, we know that one of the most effective ways of preventing an increase in the number of dogs is to tax them. We treat houses similarly, and with similar results, as we believe. In such treatment of houses we prevent their erection; we prevent the employment of labor which would be engaged in their production; we compel people to live in poorer houses, because in paying their rent they are compelled to pay the tax; and we create a multitude of evils which, to the mind of the single taxer, constitute the chief blot upon our American civilization. Why should we do it? The single taxer finds no answer for this question. He sees no reason at all for the taxation of houses. And I believe that with a fair, candid consideration even of what I have already taken occasion to say we may consider the burden of the argument shifted upon that particular point to the other side.

Take the matter from another point of view. The single taxer believes that there is an ethical principle governing taxation as well as all other relations in life. The single taxer believes that taxation is something that ought to be rendered to the State for service given by the State. What service does the State of Maryland or does the town of Hyattsville render to my house that I should be compelled to pay taxes upon that house for the benefit of either the State or the town?

Let us analyze the situation. The town improves the street in front of my house. Is that a reason for taxing the house itself? Does the improvement of that street add value to the house as such? It certainly does not. Does it maintain the value of the house? It does not. The value of my house is to be maintained or added to by something that I do or cause to be done to that house in the way of building an addition, in the way of painting, in the way of improving it in some manner. I myself can add to the value of my house, but the town, by improving the street in front of the house, adds nothing to its value. It does add value to something, but that something is the land upon which the house is located. The street improvement tends to add to or maintain the value of that land. Similarly with regard to sidewalks, with regard to sewers, with regard to water. All of these things add to the value of the land on which my house rests, but the value of the house remains the same.

Suppose the house burns down. It is going to cost as much for me to replace that house whether the street improvements in front of it are complete or whether there are any street improvements at all. The value of the house or the cost of construction of the house or of replacing it remain the same. But the town, we will say, preserves order, and therefore the house should pay the tax. The town, it is said, furnishes us with police protection and protects that house. Let us grant that the police protection operates to save that house. Let us grant that the fire department operates to protect it against fire. Does that add to the value of that house? No, in nowise; nor would the house be receiving any value. But if my house in that locality be protected from fire, be protected from robbers, the result is that the land upon which the house rests increases in value, rises continuously with the improvements of that kind. So it turns out, anything that this town of Hyattsville can do

adds to the value of my land but does not augment the value of the house at all, and yet I pay taxes on the house.

Q. (By Mr. PHILLIPS.) Do you not make a distinction between value and cost there? Is there not properly a distinction there? Could the house be as readily sold if there was no street improvement? It would cost, I admit, the same to build it, but would it have the value if built out in the woods?—A. No. It is quite possible for a person to waste money in putting up a house. His house has to conform to the general surroundings or he throws away money. That may happen in one of two ways. I might go down here in the extreme southeast part of Washington and put up a \$20,000 house and I would be absolutely throwing away my money. It would have scarcely any value at all. That is a way of wasting money. Or I may go up to the extreme northwest section of this city, where land is worth \$3 a foot, and put up, if they would allow me to do so, a frame shanty, and I would be equally throwing away my money. I can not get a proper return from that land with that sort of improvement. But either of those would be exceptional cases.

I was about to say, does anything that the State does add to the value of my house? What the State does in the construction of roads approaching that house adds to the value of the land upon which the house rests. Whatever the State does in the maintenance of order, in the maintenance of courts of justice, adds to the value of that land, and hence it happens that the State or the locality where order is best maintained, other things being equal, shows the highest amount of land value.

Now let us see some of the consequences flowing out of this argument. As I said before, if I pay money on my house, which is expended for the maintenance of street improvements or the making of street improvements, I am paying money for which I do not get a return. But somebody does get that return. Going a step farther, suppose that adjoining me there be a vacant lot; nothing has been done with it—it has remained there up to the present time without improvement. What does the town do with the money that I have expended—that I have given it? It takes the money which is raised from land values; it takes the money raised from personal property taxation; it takes the money raised from house taxation and spends it all in street improvements, and spends just as much in front of the vacant lot as it spends in front of my own place. Every facility which is afforded to the lot upon which I place the house is afforded equally to the adjoining vacant lot, and raises its value equally with any raise that may be given to the value of the property which is possessed by me. Now if, therefore, you can take taxes from me, the single taxer says, on my house, and expend those taxes just as much in front of the lot adjoining, which is vacant, as you do in front of my lot, you are guilty of a wrong to me; you are creating a privileged class in a very extreme sense of the term, and the privileged class is of the man who owns the land as such as distinguished from the man who is an improver of land, and right in that fact lies, to our minds, all the advantage that goes to the land speculator. He gets, not only the return for the tax he pays, but he gets the benefit of the taxes which other men pay, to which he is not entitled. And in that very one fact lies the secret in the mind of the single taxer of the maladjustments of society. If you can continually tax the value—if you can continually tax the property held by one man and turn the taxes over, expend them for the benefit of another man, you have a topsy-turvy condition of affairs so far as matters of taxation are concerned, and it is impossible to get a proper adjustment of industrial conditions until you come right down and meet that question and get a system of taxation upon a clear, clean, logical, and just basis—upon an ethical principle of giving a man just what he pays for, and not taking from one man and giving to another something he has not paid for. Now, without elaborating, because I am proceeding at length and do not want to weary you too much—

Q. (By Mr. PHILLIPS.) Kindly get down to farm lands in your discussion, will you?—A. I have not got to farm lands, but I will say a few words about them. It is the belief of many persons that the single tax, while it might work well enough in cities and perhaps be proper, will work harmfully to the farmers. I do not think so. On the contrary, I think the man who is to benefit, above all others, from the single tax is the farmer. But the confusion of ideas upon that point is a very natural one. The farmer looks upon himself as being par excellence a land owner. In point of fact he is not. He is a land user above all other things, but not a land owner above all other things, and there is a very broad distinction between the two. The farmers, many of them, have failed to note that distinction, and therefore have failed to appreciate the true working of the single tax.

At the present time the farmer, as a consumer, pays a heavy tax upon goods coming through the custom-house; he pays a heavy tax on his personal property, a tax that is out of all proportion to the personal tax paid by men in cities, the natural reason being that the personal property of the city man is concealed and can not be gotten at under any attempts that have been made. The personal property of the city man never has been gotten at, whereas the property of the farmer is open, and readily determined by his neighbors; it can not be concealed, so he pays those two

taxes. Go further: He pays a tax upon his house, barn, outbuildings, fencing, fruit trees; he pays a tax upon everything that he does to give value to his premises, and it will be found on careful examination, I think, that the value of improvements is vastly superior in the case of the average farm to the value of the naked land. That is, if you take the naked land—if you take a farm stripped from all these different elements of value of which I have spoken, leaving only the naked land, you will find the value is very slight. I have myself seen some very striking instances of that kind. One that I have sometimes quoted occurred in Prince George's County, Maryland: An auction was going on at the door of the court-house one day of two tracts of land almost adjoining each other, and equal distances from the railroad. In one case the land never had been improved, and that place, about 25 miles from Washington, I should say, located as it was, the land sold for \$1.10 an acre. The next piece of land was an improved farm, with fences, stables, barns, a fair farmhouse, an average Prince George's County farm house, and that sold for \$20 an acre. Of course, that is an extreme instance; but, without going into those extreme instances, without taking up time for details—the fact is, I have not the details here—I will take the liberty of referring to the most complete investigation on this particular point that has yet been made in this country, and that was made by Mr. Henry A. Robinson, a former statistician of the Department of Agriculture. It was made about 5 years ago, and covered some 6 or 8 counties in New York State and perhaps some in Pennsylvania. The investigation was made for the purpose of determining whether the farmer would be a gainer or a loser by the adoption of the system of the single tax, and his conclusion contained in that Agricultural Department report, which is readily obtainable, was that the farmer would be largely the gainer by the adoption of the single tax.

Would you briefly state in what way?—A. Because his taxes would be lighter; his tax on his personal property would be taken off; his tax on all of his improvements would be taken off; simply the value of his land would be taxed, and the value of the naked farm land is comparatively small. I said that the farmer is in confusion about the matter because he considers himself a large land owner, when in point of fact he is simply a large land user. The value of the land, and not the area of land, is the thing which the single taxer would tax. If you tax land by area, the farmer is the sufferer; if you tax land by value, he is not, because the seat of land values is in the cities. Upon this point I might refer to the report of Mr. Schilling, of the bureau of labor statistics of Illinois, made some 5 or 6 years ago, in which he points out the fact that the value of a single acre of land in the city of Chicago that he could select was greater than the value of some of the entire counties of Illinois, land, improvements, personal property, and all included. Now, the farmers of that particular county might think they were hurt by the single tax until they come to compare the value of a single acre in the city of Chicago. Similarly here in Washington we have seen lots on F street that have sold recently, lots of perhaps a couple of thousand square feet, worth as much as 50 farms in Prince George's County with all their improvements. So that the value of land is in the cities, and it is the cities which would have to pay the tax under the single tax, and not the farm lands.

From the fact that taxes would be shifted from improved lands on to unimproved lands through the operation of the single tax, the single taxers expect large consequences to follow. The single taxers find that at the present time immense quantities of land are locked out from use which ought to be used. They find that people are crowded and huddled up in cities, and that artificial conditions exist in cities. There poverty and distress are found which ought not to have any existence at all, and would not have any existence if the people could get freely to the lands. It is unnecessary to ask if I would have them all farmers, but people need land about their houses; they need freedom of space; they need land for their little gardens, for ornamentation. It is contrary to the best interests of the community that the system of taxation should be maintained that permits land to be held out of use while people are huddled up in buildings—in incomplete and improper quarters, such as is the case at the present time. The single taxer expects that with the opening up of the opportunity to get at land, that would result from the operation of the single tax, there would be an infinitely larger employment of labor.

Perhaps I should have said something in a preliminary way here: Do we think this land would be opened up? We think it would be, because the burden of taxation upon vacant land would be too heavy under the single tax to permit its being held out of use any longer. I remember a very mild illustration of this in connection with the single tax contest in Hyattsville before the single tax went into operation. Some of our landholders frequently said: Why, if we were to have the single tax, the taxes on land would be so high that no poor man could buy a lot. Immediately upon the adoption of the single tax a different thing was said, and the large landholders said: We can not afford to pay these large taxes on this land, and we shall have to sell it at any price if we don't get rid of the single tax. Their very statement that they would have to sell the land at any price tells the whole story, for

what does that mean? It means that the land would be opened up for use by people who needed to use it, because if the taxes were large, as they say, and there was no reason for their holding the property any longer for the purpose of speculation, there would be no reason for anybody else holding it for speculation. But there would be an opportunity of getting at that land and putting it to use; so, as I say, in a few words, that tells the whole story, as we believe, of what would occur through the adoption of the single tax all over the United States; of what would occur not merely with reference to city lots, but with reference to coal deposits, iron deposits, copper deposits; with reference to wharfing privileges in cities, with reference to all classes of land imaginable. You can imagine what the result would be in the way of opening up the opportunities to labor. It would be simply impossible that there should be hard times in this country. For reasons which I can not take the time to elaborate, the single taxers believe that the recurrence of hard times is because of the vicious system of holding land connected with the vicious system of taxation, and until that particular thing shall be met, there will be this constant recurrence of hard times. But I do not want to elaborate that argument, as I believe we would be able to demonstrate it if I had the time.

Now there are other features of this matter, many others, but I have been talking pretty near long enough, I think. The single taxers are such, not merely from what they consider the fiscal side of the question, which has been in fact the side that I have discussed so far for the most part, but because they believe that there is a moral and ethical backing to the positions which they take. The single taxers think that any one man upon this earth has equally as good a natural right to be here to enjoy the blessings of life, liberty, and the pursuit of happiness as any other man has, but the single taxer does not believe that under conditions as they are at present arranged every man enjoys that right. The single taxer believes that if one man owns the land upon which others have to live, the landowner possesses not only his own right to life, liberty, and the pursuit of happiness, but that of all the rest, because they can only remain upon this earth as long as they make terms with him. They have to pay him for the privilege of existence, and the single taxer does not believe that any government which permits such a violation of the fundamental natural right can continue for an indefinite length of time. He believes that such a government has in itself the seeds of destruction, which must be removed, else the government itself will perish. We may probably be called cranks for thinking thus; but we so think, and think it very earnestly.

Why should one man pay tribute to another for the privilege of living on this earth? What natural reason is there for it? I think we will all agree to begin with the proposition that one man has just as good a right as another. We must all agree that at the present time every man does not exercise that right, because he has not equal freedom with another to get at the earth upon which we must live, and from which we gain our livelihood directly or indirectly.

How does the single tax change this situation? How would it change it? How would it tend to bring about these natural rights?

The single taxer says that if the men who own the land, who hold the title to the land at the present time, paid into a common fund, to be disbursed for the common benefit, the special value which accrues to them, the special reward that they get merely because they are the holders of land, a social readjustment would be brought about.

To use a homely or familiar illustration of single taxers, if 20 men happened to be common owners of a horse, and the yearly value of the use of that horse is \$20, it would make no difference—the adjustment of the relations of all with that horse would be brought about—if a single man had its use and paid \$20 into the common fund to be disbursed to all the 20 stockholders. Now, going from the small thing to the infinitely large one, the single taxers believe that if the net rental value of land of the United States be one billion dollars a year, and the owners of land pay that billion dollars into the common fund and have it disbursed for the benefit of the whole community, in that way the equal rights of every one in that community and the land upon which they work and live will be recognized, and that there will not then be the extremes of poverty and wealth which exist at the present time when certain persons get the benefit of land to the value of which all have contributed.

Q. (By Mr. LITCHMAN.) In connection with your last statement, can you logically apply your system of the single tax unless all the land of the country comes ultimately under the central Government?—A. Yes; I think so.

Q. How can you apply your theory of taxation to the locality? Say, take a town and run that town on a single tax as against the State, which is run on the other system?—A. Perfectly well, so far as town taxes are concerned. You can not apply it in its ultimate, which excludes the idea of other than taxes on land values.

Q. You must extend ultimately, then, the centralization of the Government, and all the taxes should be under the central Government?—A. Not necessarily; not necessarily. You can divide the fund in a different way. There is not that centralization at the present time as between the State and the localities of the State, even although

the tax may be collected by the same tax collector, as is the case in some instances, as for instance in Maryland. There the taxes which are required for State purposes and the taxes which are required for county purposes both go through the hands of the same man. He turns certain taxes over to the county commissioners and certain other taxes over to the State treasury. There is not any necessary centralization of functions.

Q. How would you collect the taxes of the State?—A. That is a matter of detail which may be arranged, as it is now.

Q. I mean on what would you levy the taxes of the State?—A. Levy them on the value of the land.

Q. In addition to the levy of the town?—A. In addition to the levy of the town.

Q. Then, in the last analysis, does not it get back to the proposition that if the land is surrendered by the holder it will go back to the State?—A. There is no surrender to the State.

Q. Then who would he surrender it to?—A. Oh, if that should be the case, necessarily the State would become the owner.

Q. Then how would you levy the taxes of the nation—in the same way?—A. Yes.

Q. Then you have three systems of taxation, all applied to the land?—A. Yes; that would be the ultimate. Of course I do not expect that to be reached for many a year.

Q. Well, that is the last analysis and the logical conclusion that the system must be judged by?—A. I think it will be reached by gradual approaches.

Q. Is not that the real hope of the single taxers, that the land shall be nationalized?—A. No, no. Understand the difference between the single-tax system and land nationalization. The Socialists are believers in land nationalization, as I understand their contention. They believe that the community should own the entire land, and should determine that certain crops should be raised on certain parts, and that certain other lands should be used for certain other definite purposes, and so on. The single taxers do not interfere with the management of land at all. If you have the land you may use it for whatever purpose. You will use your own judgment as to what you will do with it. The State will not interfere with your management.

Q. (By Mr. A. L. HARRIS.) If the entire amount of taxes necessary to be raised to defray the expenses of the Government, the city, and the locality is distributed upon the land, how much would that probably be among the older States now?—A. I do not know that I quite understand the question.

Q. The question is this: If you take one of the older States—the State of Ohio, and distribute Ohio's share of the fund necessary to run the Federal Government through the State, and then its own special taxes, and then its local taxes, and the township taxes, have you ever figured how much that tax would be on land values to the acre?—A. It is absolutely impossible to answer that question with accuracy, for the want of perfect statistics. There have been several attempts made to answer it. There was one made by Mr. Shearman, who, in his work on "Natural taxation," shows to his satisfaction, and I think it would be to the satisfaction of anybody else, that what we may term the present rental value of land, exclusive of the improvements, is more than sufficient to meet all local and general taxes.

Q. Then if it is all the rent the title is sacrificed?—A. No; not at all. The title may be held as a matter of convenience; although if the taxes were levied to the extent of the entire rental value, the mere holding of the title would be merely a convenience for the purpose of retaining the improvements.

Q. (By Mr. FARQUHAR.) What is the use of the title, then?—A. No; nobody else is likely to pay more than the fair rental value of the land.

Q. Then that value would become speculative every twelve months. That would be a matter of speculation, just as we have on F street and G street, and others?—A. No; there would not be any room for land speculation, because as land went up taxes would go up.

Q. Then it would not be worth holding. The less you would have the better you would be off, either one or the other?—A. Yes; it would be worth the holding for use. It would not be worth the holding for speculation.

Q. If the land has, for public utility or otherwise, to pay the tax, what is the use of your title, what increment of gain are you making in holding simply the title?—A. I do not want you to make any gain.

Q. But that disposes of land values?—A. No.

Q. (By Mr. LITCHMAN.) Now, then, does not that get back logically to the question I asked, that in the last analysis the State would be the owner of the land, and private ownership would be useless?—A. In one sense it does; the value of private ownership—the advantage of private ownership would be gone.

Q. Then, of course, it seems to me inevitable in logic that the State would become the owner, and it simply rents the use?—A. That is practically all we get out of the earth anyway, individually.

Q. (By Mr. A. L. HARRIN.) Would it encourage improvements when the title is precarious?—A. When the title is precarious? The title would be no more precarious than now. The tax on land would increase with the increasing value of land, which is precisely what it does now, although not to the same degree. Your holding would be subject to the possibility of an increased value, of course, and that is the chance which we take to-day. It happens to-day that improvements become valueless because of the great change in the situation of land, in the surroundings of land. I can conceive that that thing might happen under single tax as it does under the existing system. On F street to-day there are improvements which 20 or 30 or 40 years ago were put up at great expense. In the buying of the ground on which those improvements are situated, the improvements are not taken into consideration; they have become valueless. I should conceive that the same thing might happen under the single tax as happens to-day in that respect.

Q. I am interested as a farmer. You spoke a moment ago, saying that the increased value of city lands would to a large extent relieve the farmer on account of his unimproved country farm land. Who would you have make the valuations?—A. They would be made as now. I do not know of any necessity of any change of detail in that respect. I do not mean to say that our details are perfect.

Q. The city would value its own real estate, would it?—A. Yes; probably.

Q. Would not the city, as it does now, relieve itself of the actual value of its real estate and throw it upon the farm lands?—A. By a system of undervaluations?

Q. Yes.—A. That is quite possible. It is possible now and it is done now. But that is a matter which, as we know, is receiving under present conditions the attention of students throughout the country, and I think under present conditions the solution will be found. One has been proposed in the New York legislature this past winter that is very probably a correct and proper one. That is to say—I do not know that I can entirely state it, but in effect it is this: The amount is determined which will be needed by the State for its purposes. It is furthermore determined how much tax is to be raised by each local community for its local purposes; and a proportion is struck between the aggregate amount of local taxes and the amount of money wanted by the State for its purposes. So that if a town uses for its local purposes \$10,000, it pays a certain amount to the State. If it uses for its local purposes \$100,000, it pays 10 times as much to the State, so that there is a constant relation under this proposed plan between State taxes and local taxes. However, that question of yours does not, I think, particularly pertain to the single tax. It is something that we have to meet in another way.

Q. What I wanted to get at was whether the inequitable valuation of city property, as the farmer believes, would be relieved under your system?—A. No; I should say no, because I do not think the system has any relation to that. I think that has got to be met in another way.

Q. How would you get at the land value?—A. I would get at the land value as now; that is to say, by the appointment of assessors.

Q. Then you would have that same disability that we are now in?—A. That same disability is not necessarily connected with the question of methods of taxation. It is connected with the relations which exist between the municipality and the State, and does not bear any relation, I submit, to the question whether you tax one, two or three different things.

Q. You spoke a moment ago about street improvements; are they not generally made by assessments on the foot front? Is not the street improved by the foot front?—A. In some localities; yes.

Q. Is it not most generally done by the foot front?—A. I would not be able to answer.

Q. If done by the foot front, the vacant lot would pay just as much as the improved lot?—A. Of course; in so far as it is done by the foot front, the vacant lot does in that item pay as much as the improved lot.

Q. In turnpikes in the country the same rule would apply, would it not, where the acres adjoining the improvement pay the cost of the improvement?—A. I have never heard of that system adopted for country roads, but it may be.

Q. Now, let me ask you this general question: Has or has not private ownership been largely instrumental in accomplishing our high degree of civilization and wealth?—A. I do not think so. I think it has been a deterrent; and for some of the reasons that I have given we can so affirm of private ownership. It has been a positive deterrent, because it has enabled land to be held out of use. This withholding of land has thrown people out of work. It has prevented the orderly development of cities, and it has resulted in some people amassing great wealth and others remaining in poverty.

I think the system of private ownership of land is worthy of all the denunciation that has been given it from the time of Lycurgus. And I want to say in going back to Lycurgus, if I may indulge in a very interesting historical example, that it is interesting to note that, according to Plutarch's Lives, when Lycurgus became ruler of Sparta there were great inequalities of wealth and great distresses. He found the

subservience and wretchedness of the poor on one side and the avariciousness and power of the rich on the other, and, as a step which was proper at that time to get rid of the inequalities, he practically abolished private ownership of land and divided it into a certain number of small holdings and so arranged the leases that these holdings could not be sold by one man to another, and that a man's interest in his holding ended on his death. It is interesting in this connection to note the fact that for hundreds of years Sparta enjoyed the highest repute for honesty and bravery and equality of its citizens.

Q. (By Mr. KENNEDY.) Sparta also abolished a great many other things besides that land system?—A. Yes; but you will find that is the fundamental influence. Read particularly, having that in mind, Plutarch's *Life of Lycurgus*.

Q. (By Mr. LITCHMAN.) How far would the French law of succession operate in the same direction?—A. The French law of succession does operate in a degree in the same line, and to that is attributed among single taxers the fact that France has suffered to a less degree than any other country from industrial depressions and from the ravages of war. Under the French system a man is not allowed to will away more than perhaps a certain amount of his land from his children, and the rest is divided in specie. The French system is not theoretically the best at all, because it divides land into too small holdings, and the most economical method of working land is not available under that system. So there are objections, as I say, to the French system; but nevertheless to a very large degree it has proved the salvation of France.

Q. (By Mr. A. L. HARRIS.) What inducement would the farmer have to improve his farm if his title were not permanent?—A. The inducement of possession. Now, I want to say one word, and then I will try to answer your question by asking another. Some of the best improvements in New York City are on leased lands, land which is leased for terms of 20 or 30 years, subject to revaluation at that time. That is true of the Snug Harbor estate in New York City and also of others. So that the lessee has security of possession without having any title at all; and what a man wants, and what he would have under the single tax, would be a security of possession so long as he paid the increased value, which would naturally come and come, not particularly to himself but to all of his neighbors, and the valuation is made, of course, for all the community. But answering the question by asking another, I would ask what security has the farmer in making improvements at the present time? The instant he makes improvements his taxes are raised, and it is within my experience, and I have no doubt within the experience of all the commissioners, that farmers have hesitated to make improvements simply because they knew it meant an increase of taxes.

Q. (By Mr. LITCHMAN.) Is not that on the basis that a man is taxed on the property that he is supposed to own?—A. He is taxed now on the property that he is supposed to own; yes.

Q. Yes; is not that a fair basis of taxation?—A. I do not think so for a variety of reasons, some of which I have given. Another reason would be that we do not know what a man owns.

Q. Well, you can only judge by the evidence that shows what he owns.—A. To tax a man on a basis of what he is supposed to own is to tax him on the basis of guesswork.

Q. Is not all taxation guesswork?—A. No; the single tax is not guesswork.

Q. Now, let us take an illustration that brings up a question I was going to ask awhile ago. In the first place you will fix the valuation, you say, by assessors?—A. Yes.

Q. Having fixed that valuation by assessors, I go on and erect a factory for somebody. That factory is engaged in a line of business where I have a very strong and powerful rival in some other locality who desires to get rid of me. He makes a bid for that property beyond what I can afford to pay, not because that is the fair usufruct, but because he wants to get rid of that factory. How would your single-tax system meet that?—A. I do not think that is a workable illustration, if you will pardon me, because there is no reason for taxing that land under the factory any more than the adjoining land.

Q. But somebody comes and offers more for the use of that particular piece of land for the express purpose of getting rid of me.—A. What would we think of the assessor who accepted such an offer as that? He could not accept that offer under his oath of office, and under the eyes of the community, unless the value of the property of the whole community had gone up in some corresponding way.

Q. (By Mr. PHILLIPS.) He would have to raise on all the other property as well?—A. Property does not rise in a particular square to an extraordinary degree and not in the other square.

Q. (By Mr. LITCHMAN.) Under your theory, as I understand, the value would be the usufruct—what a man is willing to pay for it; how are you going to fix the value in any other way?—A. We can not say that a particular piece of land is of a particularly extraordinary value because one man, desirous of getting rid of his neighbors,

is willing to buy it. It is what the community generally is willing to pay, and what generally that land is to be regarded as worth.

Q. (By Mr. FARQUHAR.) To make the matter plain, the question is this: Do you single taxers deny the right to tax property according to the use that property is put to? There is a machine shop here, for instance, a hotel in another place, and working men's dwellings in another place on the same street, how are you going to differentiate as to the value of property unless you do so on the basis of the product that comes from the property itself?—A. You can not do it by the product.

Q. Take this case. Consider a place, say, at Dunkirk, N. Y. The Brooks Locomotive Works cover 4 or 5 acres of ground, furnishing the whole world with locomotives, and employing 2,000 or 3,000 men, and that little piece of property turns out more product than the whole city besides does in any shape whatever. Taking that land alone that the Brooks Locomotive Works are built on now, how would you tax it?—A. I would tax it in conformity with the value of surrounding ground.

Q. You would tax it, would you, just as you would the neighboring ground?—A. Yes.

Q. Then all the tax on that ground collected by the present State law would go for naught. How would you collect it?—A. I do not understand you.

Q. Well, take any machine shop. Take the Sparrows Point Machine Shop, because it has a product that goes into interstate commerce, and goes all over the world.—A. To take any particular place. At the present time we tax the land, we tax the improvements, and we tax the personal property. Now, what difficulty arises because we eliminate two of those factors and simply increase the rate?

Q. (By Mr. LITCHMAN.) Simply because you transfer the tax that the Rogers (Brooks) Locomotive Works pays on its personal property onto somebody else that does not pay the tax.—A. Onto the value of land. Because other people are being relieved at the same moment, you may with equal propriety say that their taxes are put on the Rogers Works, or the Brooks, whatever they are. So you have given them exemptions on both sides, and the only person who is suffering is the man who is holding his land out of use who does not get any exemption, or the man who has inadequately improved his land.

Q. (By Mr. FARQUHAR.) Were the land owned entirely by the State and you had to go to the State to get a possessory title on your improvements and everything else, when you would be thrown off your land there would be a presumption that would rest upon the fact that the State had the original fee simple and could sell the land. But to take your proposition now and uproot the whole system of the acquirement of property and the title to property and everything of that kind seems to be the difficulty in your argument this morning; that you are really releasing the strong betterment in one place without any tax. This is illustrated in the case of the Brooks Locomotive Works. Or, take another; a few acres of brick walls; nothing but brick walls and machinery in them, and then a neighboring hotel, and then 8 or 10 dwelling houses covering the same amount of ground. Why the Brooks works under the present system of taxation of the State of New York would pay 5 or 6 times as much as any other property around it. Now, the State loses all that betterment, does it not?

Q. (By Mr. PHILLIPS.) Let me just put in one more question. Take this city. There are certain localities and streets that are much more valuable for merchandising purposes than others. Now, if a man utilizes one of those corners which is much better than a square or two around, how do you regulate the value of a particular lot or location? You value the land higher then on that corner, do you?—A. Certainly, as it is done now.

Mr. PHILLIPS. Then that answers the question about the locomotive works.

Mr. FARQUHAR. No; he has not answered the locomotive works question.

Mr. PHILLIPS. The one will answer the other.

The WITNESS. The matter that Mr. Farquhar has in mind is probably that the tax of exemption of the locomotive works would be extremely large.

Mr. FARQUHAR. Yes; and somebody will be taxed for it and somebody will have it to pay in Dunkirk who is not in the locomotive works and not getting a dividend from the locomotive works.

The WITNESS. But you forget the other proposition, and that is that all the householders in Dunkirk are at the same time escaping taxes on their houses.

Q. (By Mr. LITCHMAN.) If they have a leasehold or have what is equivalent to the ownership of land, do they not increase the charge on their land and do they not increase the charge also on their personal property? And is there not a larger exemption on the locomotive works?—A. We will take it in a larger way. In Hyattsville, when we had the single tax, our whole town basis of taxation was \$600,000. Our lands were valued at \$400,000, say, improvements at \$200,000. Now, when you took the land value as a basis, when you struck off \$200,000 from the assessment rolls, it became necessary for the tax rate on the land to be raised. The suggestion of you gentlemen, if I understand it, is that that proceeding brought the tax back and made it heavier on the householder. But it did not. It practi-

cally doubled the tax on the landholders who were holding vacant land all over the town. It raised their rate from 15 cents on the hundred to 25 cents on the hundred, raised it two-thirds; but in practically every instance with the householders their taxes were less. And yet the town raised slightly more revenue. So, you take it in Dunkirk, it is quite likely that the Brooks Company would pay less taxes, but on the other hand every householder in town would be paying less taxes, and the persons who would be paying the larger taxes would be the people who hold a cordon of vacant lots around Dunkirk and prevent its development. They are the men who would pay the taxes which were before taken out of the Brooks Company.

Q. (By Mr. A. L. HARRIS.) Have you ever figured that down to see how it would work?—A. Yes; I have in several instances. I know how it worked in Hyattsville, and it worked in that way; that is, that the householders in practically every instance with the higher rate paid less taxes. There was scarcely an instance in the town where that was not true.

Q. (By Mr. PHILLIPS.) How did you assess corner lots?—A. We took precisely the present basis of assessment.

Q. Put the value on the location?—A. Put the value on the location.

Q. You did not put as much value on the vacant land as on the improved land?—A. Yes.

Q. Then, if a man had a good location for business, he would not pay any more taxes?—A. Pardon me; we did this: Beside the name of each tax holder in the town was a column for land values, in which his land would be assessed, a column for improvements, and a column for personal property. Under the old system we would have levied a tax of 15 cents on everything in the 3 columns. Under the single tax we did not alter the assessment at all; we simply struck out the improvement column and the personal-property column and left the land-value column. That was all there was to the adoption of the single tax besides the raise in rate from 15 cents to 25 cents, a raise of two-thirds.

Q. (By Mr. A. L. HARRIS.) Now, I would like to go back to the first proposition, and that is, whether or not there is a tax on labor. Improvements are made by labor, are they not?—A. Yes.

Q. When the community is improved, it increases the land value, and does it not indirectly tax labor?—A. No; the increase of land values is not a tax on labor. An increase in tax values is equivalent to saying to the man who lives on that land, "We increase your taxes because on this land you are capable—the community taken as a whole—the community is capable of earning more money." That is just what happens on a very large scale in the city of New York. Your highest land values in New York City are about Wall street. The very largest rewards for exertion that are obtainable anywhere in this country are obtainable there; so that if you pay the tax on land values, you pay the tax for the privilege of the opportunity of earning the very highest rate of compensation. That is not a tax on labor, but a tax on opportunity.

Q. But is it not labor that makes the land valuable?—A. We say labor makes land valuable, and for rough purposes that is a sufficiently correct method of statement; but labor never does create land values. Labor in the Sahara will not give any land values to Sahara, but it has got to be labor in conjunction with the people. If you get down to the very last analysis, it is the people who create land values. The more intelligent they are, the more developed they are, and the more they advance in every respect, the higher the land values, and houses are the mere insignia of this advancement, the result of it.

Q. Under the present system, in nearly all of our States, the owner of land has received title from the Government. That may be the condition even in the city of Washington?—A. Yes.

Q. And a man owning a lot, not being able to improve it possibly to the full extent that his neighbor improves, the rate is raised on him until he is not able to pay it. Would not that be confiscation?—A. It might amount to that, and then the question arises whether that sort of confiscation is right. If he created that land value, if he can show any natural right to that land, the confiscation is wrong. But if, on the other hand, the value of that land was created by the whole community as it is, and if the land itself was never created or brought into existence by him, then confiscation of it is right. It is simply the old question of slavery over again. If, as in our case, it was right to hold slaves, then it was absolutely wrong for the Government to confiscate them.

Q. (By Mr. LITCHMAN.) Well, do you not differentiate between a piece of land and a human being?—A. No; because the man that owns the land owns the people on the land.

Q. That is an academic question that perhaps might be disputed—the conclusion that argues that there is no difference between a piece of land and a human being; but I do not know whether your use of the illustration of slavery would justify that. If you wish to leave it—A. No; I do not wish to differentiate in natural

right. As I said before, I think all people have an equal right to live upon the earth.

Q. Following out the questions to the last analysis, if a man has improved the property to the extent of his ability to improve it, and the confiscation comes, is that equal right?—A. I think the illustration as I gave it covers it all.

Q. As I say, he improved the land to the extent of his ability to improve it.—A. As I say, I think it comes down to a question of right. The man who stands in the attitude of being a landholder, doing nothing with his land, whether from poverty or any other cause, while his neighbors are building up the town around him, is doing a positive injury to the community. If he could show as clear a right to the land—as natural a title—as he can to his horse or to his house, the product of his own work one way or another—if he could show that clear title to the land, I would say, whether he injures the community or not, he ought to keep it.

Q. Is not the title to the land the same as the title to the horse or anything else, except that in the one you require a paper writing and in the other you do not?—A. No. Perhaps the illustration of a horse is not so happy as a hat, because a hat is a direct product of human industry. A man has set to work and created that hat, or by the employment of another he has created it by his own labor. But the man does not live that has ever created land or the value of land.

Q. The value of land was created in the same way, was it not?—A. By the whole community, and the whole community, being the creator, should have the benefit of the value. That is our position.

Q. Let us consider the position of the man who hires a house. If the tax is doubled on the land, will he not in the last analysis have to pay the taxes if he pays the rent for the house?—A. Value is increased either by increasing the demand or diminishing the supply. I think that is a general proposition to which you will all accede. The levying of a tax on land value does not in itself increase or diminish the supply and does not diminish or decrease the demand for land, but its tendency is to increase the supply of land so that the tax can not be shifted onto the user. If you tax a hat, you have to get that tax out of the consumer. If you are a maker of hats, you have to get it out of the consumer or you will stop making them. But you can not say that about lands.

Q. Can you not about houses, if you build houses to rent?—A. Oh, yes; about houses it is true.

Q. Well, then, if I hire a house, do I not have to pay the tax of the man that owns that house on that particular house?—A. You do; but that was not your question.

Q. Yes, it was. My question was simply this: If you shift the tax to the land, how do I escape in my rent of the house?—A. How do you shift the tax on the land? The effect of shifting to land values only is to open up the amount of land that is available for the purpose of house construction; and the minute you open up a supply of land available for that purpose you diminish the selling value of the neighboring piece of land and you interfere with the ability to shift the tax on the house user.

Q. But do you not finally get to the point where you will find all the houses occupied?—A. Yes; that is possible. We have not reached it yet.

Q. Will it not be necessary also to have the house located near where the labor of the renter of the house is?—A. Yes.

Q. Then, there is a limit to the extension of the supply of houses, is there not?—A. There is not any limit to the extension. There is not any limit in the sense of which you speak to the operations of the single tax until every square foot of land in the country is used, and used in its best way, because the single tax will in its operations continually open up new opportunities and give greater freedom for labor either for house construction or something else.

Q. Let me make my illustration on that question more concrete. Let us suppose that here on this spot, where this building now stands, there is a factory employing a dozen men. Of necessity, those men must be within easy access of this factory; and you can apply your theory, can you not? If the rent is raised on the house I now have, I can go to a house that is farther off. But there must be some limit to the distance I can go from this factory where I get my employment, must there not?—A. Yes.

Q. Does not the theory fail when I have reached that limit, and do I not then reach the point where the increased tax on the land has increased the rent on the land?—A. In order to make your illustration good, you would have to run a fence round the particular piece of land and allow no other factory owners to come upon it anywhere; otherwise, they might escape elsewhere and allow other people to come in. You can not very well assume an absolutely crystallized condition in any one place. The crystallization must exist all over the country.

Q. You must admit that in our present situation, under our present system of particular production that requires such an enormous amount of capital in one industry, the shifting of that industry is of a great deal of importance?—A. Oh, yes.

Q. Then the supposition that you make may be said to be well-nigh impossible, if not improbable. Having eventually located there and being conveniently located, the worker must accommodate himself to those circumstances?—A. Unless he chooses to go elsewhere.

Q. But is there a choice to the mechanic at the present time to migrate at his own will?—A. There is not as great choice as there ought to be, because he has not access to land.

Q. Supposing he has access to ever so much land, what is the use of his going where it is if he has not the opportunity of employment at his trade after he is there?—A. He has not the opportunity of employment at his trade because neither capital nor labor can freely get access to land at the present time.

Q. If there is some limit to the number of factories that would create a supply of land?—A. I do not myself think that there is any practical limit to the supply of factories.

Q. The factory is subject to the law of supply and demand, as is anything else?—A. I do not think there is any practical limit to the number of factories which may be erected in this country, for the reason that new wants and new necessities are continually arising, while the old wants and old necessities we have not begun to meet even here.

Q. What is the power of consumption of the individual?—A. I could only answer that question by saying it is indefinite.

Q. Is not the power of consumption of the individual dependent upon the reward or return for the labor of the individual?—A. It is limited by it. You asked me what his power of consumption is. His power of consumption is his power—

Q. (Interrupting.) I meant by his power of consumption his earnings. I thought you would catch my question and answer it in that way. Then there is a limit even if everybody in the country is consuming to the full extent of his earnings, is there not?—A. To the full extent of his earning at a given time; but the capacity of man is unlimited practically; his ability for improvement is unlimited practically. The wants and the necessities of gentlemen at this board to-day are infinitely greater than were the wants and necessities of their grandfathers.

Q. Are their necessities for food any greater?—A. Oh, they can live on just as little as ever.

Q. The natural necessities are no greater? It is merely the comforts that have become greater, is it not?—A. The necessities, in view of our modern civilization and in view of our intellectual advancement and the different ways in which they touch the community—those necessities are capable of indefinite expansion.

Q. Is it not true that whether you judge them as necessities, comforts, or luxuries, the power of a man's consumption depends on the amount of his earnings with which to gratify those necessities, comforts, or luxuries?—A. Yes; and I go a step further and say that his earnings depend on the facility with which he can get at the soil from which his earnings in the last analysis come.

Q. But if he is a mechanic and works at a factory, he has to live somewhere near that factory, has he not?—A. Certainly.

Q. Then, does it not come back to the question I asked, and that is the possibility of going to and coming from a cheaper piece of land, because he must inevitably work in that factory or get work in another factory; and if there is not any other factory he is compelled to work in that one?—A. Yes, and under necessity he is driven to inconvenient places in the outskirts, while land between him and the factory is left unimproved.

Q. We will not dispute that, and I will frankly say that I agree with the single tax, in so far as it will bring into the market unimproved land which is held by some individual who wants to get the unearned increment.—A. If you will agree that far, I do not need to say anything further. It is a system which simply involves striking out two factors in the present tax system, which seems to me hardly could be called complex.

Mr. PHILLIPS. (Addressing witness.) Perhaps you may have something to add?

Mr. KENNEDY. Mr. Ralston, the privilege has been accorded to all witnesses to fortify and amplify their testimony by the addition of other facts.

Mr. LITCHMAN. And also to fortify their statements by citations.

Mr. RALSTON. I then beg leave to add as part of my remarks so much of a report recently prepared by me for the use of the Washington Board of Trade as relates to the question of methods of taxation. It summarizes my own views as to personal taxes, a branch of the discussion to which I have only incidentally referred.

(Testimony closed.)

APPENDUM TO THE TESTIMONY OF MR. J. H. RALSTON.

WASHINGTON, D. C., March 12, 1900.

To the officers and members of the board of trade:

GENTLEMEN: The Commissioners of the District of Columbia have very courteously referred to the board of trade, for its opinion, a bill proposed to be introduced in Congress, the title of which is "An act to regulate the assessment and collection of taxes and licenses in the District of Columbia, and for other purposes," and this bill, in conformity with the rules of your honorable body, has for the past two weeks received the careful examination and consideration of your committee on taxation.

The bill before your committee is intended to provide for more systematic collection of personal taxes than at present prevails, and for a great variety of occupation taxes in the shape of licenses, some of which are reduced from the figures now obtaining.

OBJECTIONS TO PERSONAL TAXATION.

1. A personal tax is inquisitorial in its nature, as indeed is illustrated by the pending bill. It demands from the owner an exposure of the condition of his business affairs, which exposure, from the soundest business reasons, he may be unwilling to make. Justice to himself and to his creditors may forbid that he should place upon the tax records a detailed statement of his financial condition. Aside from this view of the question, he may entertain a natural shrinking from taking the community into his confidence as to matters in their nature purely personal.

2. Because of the reasons above indicated, as well as for other reasons entirely human, false returns as to personal property are rendered. The man making a false return does not commonly fear exposure of his turpitude in such action, and is unable to withstand the temptation to gain an advantage involving no fear of loss. This feeling may not be commendable, but it is at any rate well-nigh universal, and the result is that wherever the enforcement of the personal tax law is attempted truthful men suffer, while the unscrupulous gain by their unprincipled actions.

3. Personal taxes are unequal. One business may be of such nature that it can afford to stand the interference and expense of the personal tax; another business can not, and many of those engaged in it are, as a consequence, forced out of their occupations, while monopolies are fostered.

4. A personal tax does not commonly reach those at whom it is directed. For instance, if it be levied upon the stock of a storekeeper, while it may be an immediate drag upon his business, and diminish his present ability to meet the demands of his customers, it is not in the end paid by him, but by those who purchase from him. The payment of personal tax becomes one of the expenses of his business, and the storekeeper expects out of his receipts to pay his expenses and secure a reasonable profit. Accordingly, he charges and obtains, in addition to such other elements as may enter into the selling price, an amount for the goods he sells which will repay him for the tax and reoup him for the expense of advancing it. If he can not do this he goes out of business. In the last analysis, therefore, this tax does not fall upon the storekeeper, but upon the consumer. It becomes not a tax upon accumulated wealth, but a tax upon the necessities of life, vitally affecting all classes of the community, and the poor in an infinitely greater degree than the wealthy. Again, if it be sought to tax bonds and money loaned, the holder of the bonds or the lender of money does not pay the tax, but, either in the shape of added commissions or of a higher rate of interest, provides in advance for this payment by the borrower. Once more, it happens that the necessitous pay the tax, while the wealthy escape.

5. A personal tax is always a double tax; sometimes obviously so, oftentimes not so generally recognized, but always of the same character. Some illustrations have been given, and we may add the following: If a man borrow \$1,000 with which to assist in purchasing a piece of real estate worth \$2,000, and if he pay taxes upon the value of the real estate and also upon the money borrowed, he would pay twice upon the sum of \$1,000 and a total tax upon a basis of \$3,000, when his actual possessions would be worth but \$2,000. This illustration is obvious and trite, but in a larger though less obvious sense every personal tax is a double tax. Real estate increases in value according to the opportunity it affords for the possession, preservation, and production of personal property. Certain classes of personal property are produced and preserved to the largest possible extent in this country on Wall street, and there we find that the value of land, because of the opportunity thus afforded, reaches the highest possible point. The same rule applies with relation to sites offering the greatest facilities for manufacturing purposes; and, again, the residential portions of our cities, where personal property appropriate to the surroundings is gathered together and enjoyed in the largest possible degree, because largely of such fact, exceed in value all other properties similarly used. If, therefore, we tax both the

opportunity of producing, preserving, and enjoying wealth represented by personal property, and also the thing produced, preserved, or enjoyed (personal property), we are, in the truest and largest sense, inflicting double taxation.

6. All personal property can not be taxed, and for this reason such a tax operates unequally. If a man's property be invested in Government bonds they will escape taxation, while other evidences of ownership may be taxed.

7. A personal tax may be evaded. It is common, where a rigid enforcement of personal property taxation is attempted, for a man, the day before return is made, to exchange other classes of securities for Government bonds, free from taxation, and the day after his return is handed in to reexchange, placing himself upon his former footing and contributing nothing to the public revenues. The same Government bonds may be made to do duty many times over.

8. The direct effect of the personal tax is to interfere with thrift and throttle industry. To tax articles produced is to diminish their production. To diminish production is to lessen comfort and create squalor.

9. The assessor can know little of the personal property he assesses, nor can any board of assessors be made large enough to meet the exigencies of the occasion. The difference between a \$5 paste diamond and a \$5,000 gem may not be obvious to the tax officer, and so a chromo and a Murillo may be equally valuable in his eyes, while the latest product of a New England loom may seem of greater worth than a rug which has adorned the palace of the Shah of Persia.

THE TAX ON CORPORATIONS.

The preceding remarks, both in the way of general comments on the bill and addressed to the theory of taxation of personal property, have special relation to any particular tax levied upon corporations. A tax of the latter sort is a tax upon personal property, and (except it be placed upon a corporation enjoying natural or artificial monopolies) must fall under the same ban. If corporations are proper business instrumentalities, then no needless drag should be placed upon their activities; if they are improper, then they should be forbidden. The committee, however, are disposed to believe that if any special tax is to be levied as to corporations, it should be a tax (subject, perhaps, to a qualification as to those enjoying special monopolies) upon their net (not gross) earnings, this method presenting, in the judgment of the committee, the minimum of evil incident to any tax levied upon this special subject or taxation. This committee does not at this time consider the best method of dealing with corporations enjoying special monopolies, whether such treatment be through the exercise of the taxing power or otherwise.

OCCUPATION TAXES.

The bill under examination perpetuates a great variety of trade licenses, some of them being reduced in amount from the fees now fixed. This relief, of course, is desirable, but the principle upon which the bill is based remains for the most part obnoxious. If a man possesses, as we declare, inalienable right to life, liberty, and the pursuit of happiness, this right is emphatically interfered with when we compel him to pay an occupation tax, for such demand upon the part of the Government implies that he has not the right to live by pursuing a gainful occupation, unless he first pay for the privilege; that he is not entitled to the fullest share of liberty, which consists in doing whatever he may desire consistent with the well-being of others, and this for the same reason; that he is not entitled to the pursuit of happiness, because bounds are placed upon its pursuit.

Taxes under the proposed law will operate with the highest degree of inequality, and it is impossible that it should be otherwise. Banks, whose profits may be large, pay a relatively small occupation tax. Caterers, whose earnings are meager, pay a large proportion of their annual profits, in fact, so large as to interfere with their ability to gain a livelihood. Brokers, who may well earn thousands each year, pay \$100, while dealers in old barrels, whose living is of necessity of the narrowest character, pay \$10 annually. Hucksters, who pursue an occupation humble but useful to the community, are required to pay \$18 annually, while brewers, whose gains run into the tens of thousands each 12 months, pay \$100. A hackman, for the privilege of driving his hack, pays the usual earnings of several days before he is permitted to earn a dollar. If the burden of occupation taxes fell with any degree of equality upon the rich and poor there is no question that they would speedily be rescinded. As it is, the poor and defenseless are nearly taxed out of existence, while the rich accept their comparatively small occupation tax as a greater or less protection against competition, and therefore as useful measurably in the maintenance of business monopolies—a condition of affairs which is in itself a gross perversion of the taxing power. It is to be borne in mind that in certain particulars license taxes may have a place. For instance, perhaps, those engaged in given occupations should be identified, and as to certain other occupations police reasons may demand a high license. Identification could be secured where necessary by furnishing a tag

1036 HEARINGS BEFORE THE INDUSTRIAL COMMISSION.

costing 25 or 50 cents a year; but it is not within the purview of this report to discuss the police question.

PARTIAL EXEMPTION FROM TAXATION OF HOUSES OCCUPIED BY THEIR OWNERS.

In addition to giving careful consideration to the various phases of taxation presented by the bill under examination, your committee has thought the time propitious to investigate the possibility of exemption from taxation, at least partially, of houses occupied by their owners. Deeming such a course likely to prove beneficial, we report herewith a resolution favoring it to the extent in each case of \$1,000 of the assessed value.

Among other reasons bringing your committee to this conclusion have been the following:

The effect of such exemption would be to increase the number of home owners in this District, placing, as it does, a premium upon the purchase of homes and diminishing the annual outlay necessary to maintain them.

It will favor industry by lightening the burden of taxation upon this great product of labor (houses). The construction of more and better houses will be stimulated, and every industry connected therewith will feel the quickening effect of such a step, and the whole community consequently share in its benefits.

It will tend to the use of larger lots of land in connection with individual homes, because men will be better able to afford their use, and the natural effect will be increased healthfulness throughout the community.

In facilitating the purchase by our poorer citizens of better houses than they now occupy, the tendency of this measure will be gradually but surely toward abolition of slums and raising the standard of morality.

Perhaps it may appear that your committee is claiming too large a measure of benefits to flow from the lightening of taxation in certain cases to the extent of \$15 per year per \$1,000, but it must be remembered that this sum represents the full average weekly wage of a mechanic, and his surplus earnings for many weeks, or, otherwise stated, interest on \$250, a sum which, put in a house, might well mark the difference between comparative comfort and abject poverty, and which would suffice to purchase a loaf of bread daily for the year.

Your committee believe that the District of Columbia can well afford to take this forward step. Only one family in four now lives in its own home, less than 15,000 houses in the District being occupied by their owners. If all were exempted from taxation as proposed and were worth \$1,000 and upward, the diminution in revenues to result from the adoption of this measure would be \$225,000 per year, but inasmuch as an immense proportion of the houses to be affected are assessed for less than \$1,000, it is not probable that the reduction of revenues would equal \$200,000 annually.

This sum would be offset speedily by the increased production of houses, the increased basis for taxation on land values because of the larger use of land, and, in a less material but more important sense, by the improved health and developed morality of our citizens.

We believe that the District of Columbia as containing the capital of the United States should represent the highest possible ideals in matters of taxation and the loftiest tendencies so far as the well-being of her citizens is concerned. We believe that the measure proposed leans in this direction, and that it should receive the approval of the board and the sanction of Congress. We may then take pride not simply in the fact that we are the seat of government of a free people, but in the further fact that our municipality shows itself in its operations the leader in at least one matter vitally affecting the welfare of those coming under its control.

Nor can it be said that the suggestion of your committee is without precedent in principle. The exemption laws in every jurisdiction in the country illustrate attempts on the part of legislators to protect the poor against their poverty, and even the recent income-tax law did not undertake to interfere with the gains of the less wealthy. The measure suggested, therefore, would be in the line of protecting home builders in the possession of their homes.

The committee subjoin resolutions expressive of the ideas hereinbefore set forth and also add extracts from the opinions of the tax authorities of various States as to the effects of laws compelling personal tax.

Very respectfully submitted.

RESOLUTIONS.

Whereas the opinion of the Board of Trade has been asked by the Commissioners of the District of Columbia relative to a bill intended to be proposed to Congress entitled "An act to regulate the assessment and collection of taxes and licenses in the District of Columbia, and for other purposes," and the same has received our careful consideration.

Resolved, That if it is desirable, as proposed in the bill under consideration, to exempt church property from taxation, with equal reason should charitable institutions conducted not for gain be exempted.

Resolved, That taxes should be collected semiannually instead of annually, as proposed by said bill.

Resolved, That, believing a tax on personal property inimical to the best interests of this District, we are opposed to the enactment of any law providing therefor.

Resolved, That if any special tax be levied on corporations not enjoying public franchises such tax should be levied on net earnings.

Resolved, That occupation taxes should only be levied to insure identification and for police purposes, or only in the event of absolute necessity to insure revenue, and the said bill should be so amended as to attain this end and no other.

NEW YORK.

The tax upon personalty is therefore unjust as between individuals; unjust as between communities, and, as experience has shown the world over, it is impossible of even approximately just administration. Then why should it be continued?—(Report for 1898 of Comptroller James A. Roberts.)

To successfully enact and enforce an equitable law which would reach every description of personal property and so distribute the burden as to make it light for all, only four things were necessary:

First, to amend the constitutions of the States; second, to amend the Constitution of the United States; third, to amend the constitution of human nature; fourth, to amend the constitution of things.

The Constitution of the United States would have to be amended, for under it full one-third of the personal property in this city is placed beyond the reach of State tax laws.

The constitutions of other States would have to be amended so that their laws shall conform to yours, for you might as well burn down certain business portions of the city as to attempt to enforce such a law in the face of competing rivals with more liberal tax laws.

The constitution of human nature and of things would have to be amended, or persons and personal property would hide or die, or fly to other countries beyond the reach of your amendments, impelled by the instinct of self-preservation.—(Letter from George H. Andrews, commissioner of taxes in New York.)

MASSACHUSETTS.

The taxation of personal property in the form of securities and investments is thus a failure. It is incomplete, uncertain, not proportional to means as between individuals, grossly unequal in its effects in the different parts of the State. The experience of Massachusetts in this regard is the same as the other States in the Union.

Everywhere, without exception, the testimony is that this part of the system of the general property tax is unequal, unsuccessful, often demoralizing to tax officers, always irritating to taxpayers. (The commission appointed to inquire into the expediency of revising the tax laws of the State, report issued October, 1897.)

NEW JERSEY.

It is now literally true in New Jersey, as in other States, as has been well said by another, that the only ones who now pay honest taxes on personal property are the estates of decedents, widows and orphans, idiots and lunatics. (Commission to investigate the subject of taxation, appointed by Governor Griggs, reporting in 1897.)

OHIO.

The system (providing for personal taxation) as it is actually administered results in debauching the moral sense. It is a school of perjury. It sends large amounts of property into hiding. It drives capital in large quantities from the State. Worst of all, it imposes unjust burdens upon various classes in the community; upon the farmer in the country, all of whose property is taxed because it is tangible; upon the man who is scrupulously honest, and upon the guardian and executor and trustee, whose accounts are matters of public record. (Report of taxation commission in 1893.)

ILLINOIS.

The following tables graphically express the demoralization to which Chicago has been reduced by the general property tax, and indicate the goal toward which every community subject to that or a similar system must invariably tend. The tables are direct indictments of assessors and wealthy and influential property owners, and incidentally they condemn our constitutional principle of taxation itself. (Report of bureau of labor statistics for 1894.)

WEST VIRGINIA.

Things have come to such a condition in West Virginia that, as regards paying taxes on this class of property, it is almost as voluntary and is considered pretty much in the same light as donations to the neighboring church or Sunday school. (Tax commission report, 1884.)

PENNSYLVANIA.

The establishment of personal taxes by law would "injure the business interests of the city and stop or retard the growth of our industrial establishments." (Report of the committee of the common council of Philadelphia, February, 1871.)

CALIFORNIA.

The experience of California furnishes perhaps the latest example of the utter failure of all schemes for taxing personal property to work out anything like an approximation of justice. (Who Pays Your Taxes? G. P. Putnam's Sons, publishers.)

MARYLAND.

This question was propounded by tax commission of 1881 to the appeal tax court of Baltimore: "To what extent do you succeed in reaching investments made by residents of this State in private securities of any kind?" The answer was: "We utterly fail in reaching private securities of every description. Here and there only have they been returned by some conscientious holder." The city collector was asked by the same commission: "Does your experience enable you to suggest any effective way of collection?" His answer was: "No!" (Report of bureau of industrial statistics, 1894.)

WASHINGTON, D. C., June 13, 1901.

TESTIMONY OF MR. D. P. HUTCHISON,

Chairman board of trustees of Charlotte Township, Mecklenburg County, N. C.

The commission met at 10.05 a. m., Mr. A. L. Harris presiding. At that time Mr. D. P. Hutchison was introduced as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. TOMPKINS.) Please give your name and address.—A. D. P. Hutchison, Charlotte, N. C.

Q. Have you a paper prepared?—A. I have a paper.

Q. Will you first state what contact you have had with the building of roads, and where and when, in order to give to the commission some information as to your experience?—A. I have been chairman of the board of trustees of Charlotte Township, Mecklenburg County, N. C. I have had direct charge of the opening of many of the roads and the repairing of all of the roads in that township for the last 10 years.

Q. Have you had any contact with the county organization of road building?—A. Only, you may say, in a consulting way.

Q. Your experience in repairing would give you a good opportunity of observing the deficiencies of construction?—A. Yes.

Q. Have you had any opportunity to observe the working of free labor and of convict labor?—A. Yes; by comparison. The convicts have been worked right there, not under my charge, but under my observation.

Q. Why were there two different gangs of labor, one free and the other convict?—A. The convicts are worked under the control of the county commissioners, who up to the present time have been building all the macadam roads in the county. The township force at the present time have been engaged in repairs almost entirely,

and it has been done almost entirely by free labor, whereas the county uses convict labor.

Q. Now, if you will read your paper, I think we can formulate a number of other questions that will be of value and of interest.

(Witness reading:)

MR. CHAIRMAN AND GENTLEMEN OF THE COMMISSION:

"Allow me to thank you for the compliment paid North Carolina, Mecklenburg County, and myself by the invitation given me to testify before you in behalf of one of the greatest educational and commercial movements of the closing years of the nineteenth century.

"This movement for road improvement started not in the country, as would seem natural, but in the towns, where its strongest advocates and supporters were to be found. It was the citizens of Charlotte who submitted to a road tax, in addition to their town taxes, that made possible the building of the first macadam road in Mecklenburg County. The first crushing plant in this county was bought by the trustees of Charlotte Township and placed in the hands of the county commissioners, who had been constructing a stone road with convicts, using stone hammers, a slow and expensive method.

"It has been the policy of Mecklenburg County to build out from Charlotte on the main roads, in rotation, a mile or more at a time. This was thought best, as every one coming to town would have the use of a mile or so of good road, and this plan has been pursued until we have some 90 miles divided among 13 roads, or an average of about 7 miles to the road, with the work of building going on at the rate of 8 to 10 miles per annum.

"An election is to be held this fall at which the people will be asked to vote \$200,000 to complete the macadam to the county lines. The value of suburban property has increased much more than has the value of city property. Farming lands on macadam roads within 2 to 10 miles of town have increased from 50 per cent to 100 per cent in value in the last 10 years. People living 3 to 5 miles in the country frequently attend church services at night, and send their children to the city high schools.

"Rural mail delivery has been made possible by the advent of good roads, thus bringing the farmer into direct daily contact with the movements of the business world and giving him a knowledge of the prices ruling in the different markets.

"A few years since 4-horse teams were the rule; now they are exceptions. I know of only one within 6 miles of Charlotte, and I think that it is used more as an advertisement than from necessity.

"The supply of wood was formerly drawn from a territory not extending more than 5 miles out; to-day it is brought as far as 10 miles and sold for less, so that both the farmer and the dweller in the city are benefited by the reduction in the cost of transportation. This transportation cost has been reduced at least one-half by good roads.

"Mecklenburg County has two camps of convicts, averaging about 75 men, with teams, rollers, and crushers, etc. The men are kept in portable quarters, heated by stoves in winter and well ventilated in summer.

"The quarters, 60 by 17 feet, cost \$300, stables (7 teams) \$50, commissary \$50, guard quarters \$50. Convicts cost to work 28 cents per day. Stone is 67 cents per cubic yard placed on the road, as per report of C. A. Sprat, county engineer.

"Charlotte Township has an outfit which is chiefly used in repairing and overhauling, though we have done some construction. The first and most important question, once it is decided to build a road, is the location. The first consideration then is the grade; the second, the cost of maintenance; and the third, the cost of construction.

"Theoretically, a level road is the one to be sought after, but experience has taught me that a one-half per cent to 1 per cent grade is preferable, as better drainage is to be had, upon which the life and usefulness of the road depends. I speak feelingly as to the level road, as in the summer of 1899 I had to take up a mile of macadam, put back the earth that had been removed, and then replace the macadam, and then I did not have fall enough to get rid of the rainfall as rapidly as I would have liked. The people who had for years been traveling this section of road and floundering through the holes that had developed by reason of the fact that there was no drainage were loud in their praise of the change, and asked why it had not been so constructed in the first instance, as it would have cost less by one-half.

"A road, like a crop, to do well should have the benefit of the sun. It does not prosper in the shade. So always locate it, if possible, on the sunny side of the hill or forest, on account of rains and frosts.

"Distance should always be sacrificed in favor of grade. The grade should never break on a fill, but at either end, so as to keep as much water off the fill as possible. Ditches should be made on all embankments to prevent washes."

[I would add that this last was a suggestion of Mr. Tompkins some years ago when passing over one of our roads, and we took it up.]

"The grades established and the fills and cuts made, the preparation of the road bed for the first layer of stone demands the attention of the supervisor. With a little practice most of the earth required to be removed can be displaced with a road machine, leaving the bed with the same crown that you wish for the macadam. The bed should now be thoroughly rolled and all depressions filled in. Spongy places should be dug out and filled with dry earth.

"The bed is now ready to receive the bed rock, which should consist of 6 inches of stone broken so that it will go through a 3-inch ring, evenly spread by a dumping wagon or by being cast with a shovel, never by dumping and pulling to place with a rake, as there will always be more stone where the dump was. A heavy harrow is of great assistance in leveling the stone preparatory to rolling.

"The second layer should consist of 3 to 4 inches of stone broken to go through a 2-inch ring, with everything that will go through a 1-inch ring taken out. This layer should be sprinkled and rolled until there is no impression of the rolls visible. The third and last layer to be put in consists of the screenings or any stone less than 1 inch in diameter, which should be spread on to the depth of 1½ to 2 inches. I find that, if it is possible, it is best to flood this coat with water in the evening and leave it until it is dry enough the next day not to stick to the rolls. It should then be rolled until it is so firm that a piece of the material used, thrown under the rolls, will be crushed and not be forced into the surface.

"The repairing of a macadam road in my opinion requires more skill and intelligence than the original construction, as there are more varied conditions to be met with. For the first few years the loosening of the surface of any depression and the filling up of the same with broken stone not larger than 1½ inches will keep the road in good shape, if the proper quantities are used. But after 4 or 5 years' usage it will generally require to be surfaced with 3 to 5 inches of stone.

"To do this, first fill all the ruts and depressions with broken stone, insert the spikes in the large rolls, and break up the surface of the road by going over it with the roller. This will not break the bond so that a heavy harrow (5 by 5 feet), with teeth 1½ by 12 inches, will leave it looking as if a roller had never been used. To properly shape up or crown, use a road machine, as it does the work rapidly and economically. The spikes having been removed, the surface is thoroughly rolled to prepare it for the reception of a coating of 3 to 4 inches (1½ inches stone), which is put on to replace what has worn and been blown or washed away. The further treatment is the same as in the original construction. To get stone for this work it is necessary to set the jaws of the crusher very close, thereby diminishing the capacity about one-half. With the exception of about the first 10 or 15 yards of screening or small stone which has to be dumped, the entire output of the crusher may be disposed of at one handling. This work costs about \$100 per mile, or 80 cents per cubic yard.

"A serious drawback to this work is the use of large stone in the first layer, which is done by some road builders to save the cost of crushing, whereas the extra labor in placing, and the greater quantity required, to say nothing of the greater wear in the roller, make their use much more costly in the first instance. In spiking very many of the large stones are brought up and have to be taken out, causing a break in the foundation, which is hard to repair.

"Our rule is that no stone is to be put on the road that does not pass through the jaws of the crusher, and that no clay or loam shall be used as a bond. In some instances we have had to take up all the stone, putting the bed rock through the crusher, as we could not get a satisfactory job otherwise.

"The amount of money that is being expended in the building of improved roads most certainly calls for special legislation for their preservation. The greatest destroyer of a road, stone or earth, is the narrow-tired wagon with its axles of even length. The average width of tire is not over 1½ inches, which after a few months' use is rounded off to an inch or less. All that the wagon will bear is usually put on (if on an improved road), so that we have four wedges, a little blunt it is true, working away to loosen up or grind the bond of the road. With the small stones out they go deeper, working out larger stone, and the persistence with which each wagon follows in the track of the one preceding is sickening to the eye of the road supervisor.

"Charlotte Township had enacted by the last legislature a bill to impose a license on all wagons in the city and township with tires less than standard width, which is—

"One-horse wagon, tire 2 inches wide, spindle not over 1½ by 7 inches.

"Two-horse wagon, tire 3 inches wide, spindle not over 1½ by 9 inches.

"Three-horse wagon, tire 4 inches wide, spindle not over 1½ by 10 inches.

"Four-horse wagon, tire 5 inches wide, spindle not over 1½ by 10 inches.

"The license is \$1.50, \$3, \$4, and \$5. Wagons now in use are exempt until new tires are required. This legislation is not what was wanted, but was the best to be had.

"Why such a prejudice should exist against the broad tire is hard to conceive, as everyone who has given it a fair trial is its advocate. The question of draft is in its favor as has often been proven by the most careful tests. The life of the wagon with the broad tire is 50 per cent greater than with the narrow tire.

"In constructing a road across a marsh some three years since, having put on a foot or more of earth our wagons with 4-inch tires were going over nicely with a load of 1½ yards of earth while a light surrey came along, and much to our surprise, cut through and had to be helped out. On the same road a team of small mules were hauling wood with a wagon with well-worn tires, which so cut up the road that we had to shut them out.

"The cost of repairs to streets and roads in a few years could be cut down from 50 per cent to 75 per cent in city, town, and country if the broad-tired wagon with short front axle could be substituted for those now in use, and without any additional cost to anyone."

Q. Do I understand that last sentence to be to the effect that by the use of tires of proper widths you can cut the cost of maintaining roads 50 per cent?—A. From 50 to 75 per cent.

Q. And you say, also, with tires of proper widths the draft would actually be lighter?—A. On macadam roads the tests show there is frequently very little difference; on earth it is from 20 to 50 per cent in favor of the broad tires.

Q. And yet the people at large are prejudiced in favor of the narrow tire, in spite of these facts?—A. Not so much the people as the wagon manufacturers. Originally, the tires were much wider, but the wagon makers in figuring out the expense of building kept cutting down on iron until they got them down as low as possible to sustain the load. I had a conversation with one of the largest manufacturers in our State last winter, and he said, "We do not like to make these wagons, because there is not anything like the profit there is in the narrow tire; and then, again, they last so much longer." We have 2 wagons that have been in use for 5 years, never having been under shelter for a day. In that time the tires have been cut once, and they are good for 5 years more.

Q. They belong to the township and are used in keeping the roads up?—A. Yes.

Q. Will you give to the commission a synopsis of the plan of building and keeping roads in repair in Mecklenburg County?—A. We have two taxes—a county tax, levied by the commissioners for the whole county, and that amounted last year, I think, to 30 cents. It is now fixed by law at a minimum of 30 cents. For the township they usually levy a tax at a minimum of 10 cents, but it can be as high as 30 cents, for township purposes, in addition to what is known now as the public-road tax or highway tax. The highway is the macadam road constructed by the county commissioners.

Q. What is the aggregate money collected by the county in those two funds?—A. I think about \$50,000—between \$40,000 and \$50,000.

Q. (By Mr. FARQUHAR.) Does the county benefit any from the State tax for roads?—A. None at all.

Q. By Mr. LITCHMAN.) Is there any assessment on the abutters in the building of the roads?—A. No.

Q. It is paid from the general tax?—A. Yes.

Q. Does the building of your roads contemplate also sewerage, or have you reached that problem yet?—A. No sewerage; we have that established in the towns.

Q. (By Mr. TOMPKINS.) It does constitute drainage, however?—A. Yes.

Q. Is there any difficulty about the citizens of the county paying the tax and not getting roads built to their places or near their places?—A. There has been some clamor about not getting a proper division, but I think that is pretty well passed away now, and they find by adopting the plan of rotation—a mile or two on each road—none have to go more than a short distance until they reach a macadam road.

Q. This matter of issuing bonds to the extent of \$200,000 to at once extend the roads to the county line would overcome that?—A. To a large extent.

Q. Is it not due to that sentiment that the movement has been brought about for borrowing money to finish the roads?—A. Everybody should get the benefit as well as pay the tax. Many have been paying taxes for some years and still the road is some miles from their place.

Q. Can you give us an approximate list of the machinery necessary to make a complete equipment—first to build a road as it is done in your county, and, second, to keep the road in repair?—A. The outfit should consist of a portable engine of, say, 15 horsepower and a portable crusher, with bins that could be set up. We have a portable bin, but I do not like it, because it is too small. I have never seen one big enough. I prefer a portable bin put up in sections, which can be taken down and set up in a very short while. There should be a road machine, a large plow, a harrow, and a steam roller.

Q. What weight of steam roller?—A. Twelve and one-half tons I think is preferable for country work, though we use a 15 ton. I would not like anything less than

12½ tons. There should also be scrapers. That same machinery will do all necessary repairs. A sprinkler should be included.

Q. What would that whole equipment cost for an ordinary county?—A. That outfit would cost about \$6,500, I think. There is another item I left out; that is teams.

Q. How much more would it cost to get the necessary equipment of wagons and mules or horses?—A. Well, put that cost at \$2,000 additional.

Q. That would make a total sum of \$8,500?—A. Yes.

Q. I want to get at whether in your judgment a county that did not feel disposed to expend that much money at once could with a smaller equipment commence the building of roads?—A. Yes; most of them commence with considerably less than that.

Q. Could you give the very simplest outfit with which it would be possible for a county, whose people would not very willingly tax themselves, to begin the construction and thus demonstrate the value of good roads?—A. It could be done with hand hammers, but not satisfactorily. The cost of the work would be entirely too much.

Q. Was it started in your county in that way?—A. It was.

Q. If you had required \$8,000 or \$10,000 worth of machinery in the first place it would never have been started?—A. No.

Q. Could it be started in any other way than by starting by hand and demonstrating the value there was in it?—A. I think not.

Q. Are there not probably a great many people who would have to go through the same process?—A. Yes.

Q. Is not a road built by cracking stone by hand with hammers infinitely better than a great many of the older roads not practically built at all?—A. No question about that. With sufficient care a No. 1 road can be built by hand.

Q. (By Mr. FARQUHAR.) In your crusher do you use screens?—A. The screen is generally about a 2-inch perforation, and just the tailings go over the end.

Q. What do you use for binding?—A. We use anything that will go through the inch ring. It is better to have stone of that size, at least a mixture of it, than of the fine screenings, because the fine screenings are very liable to wash off.

Q. Do you use gravel at all, or is there any to be found?—A. We used some decomposed granite one time and found it very satisfactory. Before we had a crusher we had a piece of road turned over to us and no binder put on; in fact, nothing less than 2-inch stone. There was about a mile of it, and the people would go around 3 miles to keep off it.

Q. What experience do you have in the matter of ruts in your macadam roads?—A. They will form a rut and everything in the county will strike that when it comes onto the road.

Q. What do you have to do—rake in?—A. Fill that in with broken stone. There is enough on the ground that you can rake in.

Q. Have you any system of inspection on your roads to see that they are not abused by any party, or is the road left to take care of itself after you have made it?—A. We have a man whose business it is to go about from one road to another, and who has charge of all repairs and everything, and who is employed constantly.

Q. (By Mr. TOMPKINS.) Bad places are reported to you, are they?—A. They are reported; yes.

Q. (By Mr. A. L. HARRIS.) Has he any authority to keep heavy loads off the pike in soft weather?—A. No.

Q. Does freezing and thawing soften your roads at any season of the year?—A. That is a question that practically never has to be contended with. Probably once in 10 years the matter of freezing is to be considered.

Q. Can your inspector exclude small tires?—A. No; our bill on that subject goes into effect the 1st of August. We do not exclude any tires now in use, but all new wagons purchased have to have the standard width of tire or pay a license.

Q. Do you think your license sufficient as a deterrent?—A. Yes; I think so. We had it considerably higher than the figure named, but it was a question of getting it through at all.

Q. (By Mr. TOMPKINS.) That was a special enactment?—A. Special for our township.

Q. What do you think of the use of convict labor for building roads in a county as compared with the use or employment of free labor?—A. I think it is the labor for building roads.

Q. You think it is the best use to put convicts to?—A. By far.

Q. And you think the road is built cheaper than if you employed free labor?—A. Yes.

Q. Do you think the use of convict labor on the highways has in your county been instrumental in lowering the wages of free labor or interfering with any profitable employment that free labor has?—A. It has not.

Q. Has it had the effect of causing an indisposition on the part of the free labor to engage in the manufacture of roads?—A. No.

Q. (By Mr. TOMPKINS.) You actually employ free labor in the townships and convicts in the county? How many people are there in your gang of free laborers?—A. We work 15 to 30 men.

Q. White or colored?—A. All colored.

Q. Are the convicts mostly white or colored?—A. Ninety-eight per cent are colored.

Q. (By Mr. KENNEDY.) Do you mix your white convicts up with the colored?—A. They work side by side.

Q. (By Mr. TOMPKINS.) Will you give us an idea of the terms of the law by which the county keeps its own convicts and works them on the public highway instead of sending them to the State penitentiary?—A. There is a special act by which the judge, in passing sentence, can sentence a man to labor on the public roads instead of sentencing him to the penitentiary. Long-term convicts are usually sent to the penitentiary.

Q. Is there any limit to the discretion of the judge? Are there any convicts that the county could not keep, but that would have to go to the penitentiary?—A. I think that in cases of murder and arson they are probably required to go to the penitentiary.

Q. Into whose hands are these convicts turned when the court releases them?—A. They are put in charge of the county commissioners.

Q. The county commissioners have absolute authority over this whole organization of road-building convicts?—A. Yes.

Q. Of course, none of the county commissioners do any work or do any more than direct the terms under which the labor shall be employed?—A. They have a county engineer, who is elected by the county commissioners.

Q. How much compensation does he get in your county?—A. I think he only gets \$40 a month.

Q. He has other employment?—A. Oh, yes; he is city engineer, and he does outside work.

Q. In other words, for \$40 a month the county commissioners are able to get good engineer services to lay out the road and give all the data for its construction?—A. Yes.

Q. Who is in charge of the work on the ground?—A. There is a superintendent of convicts, who is elected by the commissioners.

Q. How much does he get?—A. Fifty dollars a month.

Q. What assistants has he?—A. He has 4 or 5 guards—whatever is necessary.

Q. Guards night and day?—A. Yes. I think probably 1 guard at night, and 4 or 5, or possibly 6, in the daytime, according to the number of men.

Q. This whole organization lives practically in camp?—A. Yes. They have portable barracks built of inch lumber put up in panels.

Q. They build their own houses?—A. They build them. A man can take down his quarters in the morning, move them 10 miles, and put them up and sleep in them at night.

Q. How much road is usually built from one camp?—A. From 2 to 2½ miles is about as much as they build from one set-down.

Q. Is the camp about midway?—A. They locate it about as near midway as possible, water and everything considered.

Q. (By Mr. LITCHMAN.) Are long-term convicts used?—A. No; they are short term—up to 3 years. I have known one as long as 12.

Q. (By Mr. TOMPKINS.) Many of them 30 and 60 days?—A. Yes.

Q. (By Mr. LITCHMAN.) Do these longer-term convicts develop any particular skill in road building?—A. Yes.

Q. (By Mr. TOMPKINS.) Does the whole organization acquire special skill?—A. Yes; in the distribution of the stone.

Q. And in the moving of camp; do they get so they can do that without instruction and without trouble and quickly?—A. I do not know about that. I have never witnessed it.

Q. (By Mr. LITCHMAN.) How far is this comparative excellence between convict labor and free labor due to that fact?—A. It is from their enforced training. They have to stay there and stick to it, while the other fellow may want to get off to a picnic or to hear the band play.

Q. In regard to hours of labor employed, are they the same in both cases?—A. No.

Q. How do they compare?—A. We work 10 hours a day with free labor; the convicts work from sunup to sundown.

Q. In winter that is short hours and in summer longer?—A. Yes.

Q. Is there any evidence of its being any particular hardship to put the convicts on the road instead of sending them to the penitentiary?—A. No. I think they prefer it. Their friends can visit them on the road on Sundays, and so on. I was out at the camp not long ago with some gentlemen, and a man was telling us about a boy whose term had expired a few days ago and who had a convict friend. He said, "Jim, you have a month longer to stay, and if Mr. Lytle will agree to it I will stay

in your place. I would rather stay here than go home." I do not think there are many instances of that kind, but that was an actual occurrence.

Q. You spoke of there being very few 4-horse teams in the county now. That is because of the fact that as good a load can be hauled with 2 horses as formerly with 4?—A. Formerly they would haul a half to a cord of wood with 4 horses, and now they bring a cord and a quarter with 2 horses.

Q. Will you give some idea of how you find it best to locate macadam on the width of a road—the middle or one side?—A. Our custom is to put it about in the middle, and then we have a dirt track on either side. We find it is easier to maintain 2 dirt tracks—1 on each side—than it is when we have all on 1 side, because the disposition of the people is to stork to the clay track after it becomes wet and cut it up without going on the stone road. It is easier on the teams to drive on the clay.

Q. What thickness of macadam do you put down?—A. We try to get it about 9 inches.

Q. And how wide?—A. Twelve feet. I do not like the 12-foot width, because it is not wide enough to pass on, and it is just a waste of 25 per cent of the road, in my opinion. If you would add that to the length it would accomplish every purpose.

Q. What do you think the width ought to be?—A. I would build it from 9 to 10 feet for a single-track road; if wider than that I would make it 16 feet, so that wagons could pass.

Q. Do you know what, in round numbers, is the cost of building an average road in the kind of country that your county is—hilly and rolling country—the approximate average for 50 miles of road? If you are going to issue bonds you will have to find it out.—A. Mr. Spratt has figured it out at \$2,800 per mile.

Q. A graded road, macadamized, 12 feet wide and 9 inches thick?—A. Yes.

Q. Suppose you would cut that macadam down to 9 feet wide, it would cost correspondingly less?—A. Twenty-five per cent less.

Q. What materials do you use mostly?—A. Field stone hauled in by farmers and piled up at intervals along the road where they wish to locate it.

Q. What are the farmers paid for the stone?—A. Forty cents per cubic yard.

Q. Who measures it?—A. The county engineer.

Q. Who piles it?—A. The farmers.

Q. He gets his pile ready to be measured up and gets the county engineer to go and measure it and give him a certificate for his money?—A. Yes.

Q. Do you get enough stone from the farmers?—A. Yes; there is very seldom any trouble. In some neighborhoods there is sometimes a little trouble.

Q. You then have to quarry it?—A. It has to be quarried then, yes; but I have not known an instance in 5 years where it was necessary to quarry.

Q. I understood you to say that in building embankments you arrange to build them in a way that you can get a ditch on the side, the same as through cuts or on level ground?—A. Yes.

Q. You find that necessary because the embankments wash down?—A. The rains accumulate the water and it overflows. A big rain will take out 15 or 20 loads of earth, and it will take 25 loads to replace the 20.

Q. Have you ever planted anything on the embankments to keep them from going to pieces?—A. We use Bermuda grass on all embankments.

Q. Has it been successful?—A. Very. After 2 or 3 years a stream of water 2 or 3 inches in depth and several feet wide can run down an embankment that has Bermuda grass well set and it will not wash out.

Q. What is your provision for surface drainage?—A. Our rule is to get rid of the water as fast as possible. We simply cut the ditch through in order to get rid of it.

Q. Between the hedge and roadbed do you make a guttering?—A. No; a plain ditch.

Q. Is there any cleaning out in that at all so as to assist drainage?—A. We build these ditches with the side sloping next to the road, and we use the road machine to clean it out always. That saves very much of the labor.

Q. (By Mr. TOMPKINS.) Where a county like this spends \$50,000 a year, is the improvement worth the money to the people in the county?—A. They think so.

Q. Is it worth much more than the money?—A. I think it is, from the very fact that lands bring better prices and it is easier to market products.

Q. Are many products marketed over these roads that were formerly not marketed at all, like milk and butter?—A. Yes; I recollect one dairy as much as 8 miles out.

Q. Before they had the macadam roads, how far out could a dairyman live and keep up a milk route in town?—A. I have known the time when they were just along the edge of town. I had one dairyman tell me he could not afford to market his milk, the roads were so bad.

Q. How much more would the road building cost with free labor than with convict labor, in your opinion?—A. I think it would cost anywhere from 30 to 60 per cent.

Q. (By Mr. FARQUHAR.) Do the convicts receive any compensation for their labor at all?—A. None at all.

Q. How much does it cost per day to feed these convicts?—A. The cost varies from 25 to 31 cents each, owing to the number on hand.

Q. Is there to be added to that the cost of the guards?—A. That includes guarding, food, medical attention, and clothing.

Q. What is the average rate of wages in that same section for free labor of the same class?—A. About 60 cents per day.

Q. Is there not other comparison in your State with respect to convict labor besides this road labor?—A. We have the penitentiary and a State farm. We also lease the convicts to railway companies for construction work.

Q. Is that leasing done through State officers or county officers?—A. It is done through State officers. One county may lease to another county prisoners to work on the road. The judge can so order.

Q. (By Mr. TOMPKINS.) And they do do it?—A. And do do it; yes.

Q. (By Mr. FARQUHAR.) In construction, then, your entire labor is convict, with the exception of your foremen and bosses?—A. Yes.

Q. Do you think that your people would have adopted this good-road system if they had had to pay free labor at the rate of 60 cents a day?—A. I think not. I am confident they would not.

Q. Do you think it would be possible to build the roads and maintain the taxes if you had to pay 60 cents?—A. I do not think they would have undertaken it.

Q. So the fact is the reform in respect to your road building in your State has been brought around on account of convict labor and its cheapness?—A. Yes.

Q. What is the shortest term of any of the convicts employed on the roads?—A. They send them out there probably for the smallest fine. They go there from the recorder's court. If they fail to pay a fine, they are sent to the road to work it out.

Q. How a long a time?—A. Fifteen days up.

Q. So that you utilize all your convicts?—A. We utilize everything; yes.

Q. Previous to the road-building era how were your convicts employed?—A. Those of long term were sent to the penitentiary and the very short-term prisoners were kept in jail.

Q. Kept at the expense of the county?—A. Yes.

Q. (By Mr. TOMPKINS.) Do the people pay this road tax more or less willingly as time goes on?—A. There is no complaint about paying the road tax.

Q. Would they in the beginning have paid what they now pay?—A. No.

Q. And was there any complaint about what they did pay?—A. There was very great complaint about it.

Q. That complaint has disappeared?—A. Yes. There were people in the township—citizens of the town—who first thought they would bring suit. They objected to paying the road tax; but they canvassed the matter and decided that they would try it for a year or two. They continue to pay it, and no suit has ever been brought. Mr. Tompkins pays a road tax in the town the same as I do in the country.

Q. (By Mr. FARQUHAR.) How many miles of road have you now improved?—A. About 90 miles of macadam road. Most of that is paralleled by dirt track, and some of it has dirt track on either side.

Q. (By Mr. TOMPKINS.) Which you use in good weather?—A. It is used 8 months in the year.

Q. (By Mr. FARQUHAR.) What has been the entire cost of that 90 miles?—A. I could not tell you.

Q. You said about \$2,800 a mile?—A. Yes.

Q. And that probably would hold as an average over the whole 90 miles, according to Mr. Spratt's estimate?—A. Mr. Spratt figured that as the cost.

Q. That would make \$250,000?—A. Not far off. I know in our township we have spent \$40,000 in the last 6 years.

Q. Would the people have considered voting bonds at all before this system was developed?—A. No.

Q. And yet you say they are considering the expenditure of \$200,000 on top of this \$250,000 they have already expended?—A. Yes.

Q. Besides this cost of construction, what has been spent in the township in repairing these roads?—A. We have spent about \$40,000 in the last 6 years. We have done considerable widening of the earth roads.

Q. (By Mr. A. L. HARRIS.) Who builds your bridges?—A. The wooden bridges are built by the convicts.

Q. The larger bridges?—A. The larger iron bridges are built by contract.

Q. Does the contract in such cases include abutments and approaches?—A. The abutments are generally built by the convicts.

Q. How many months in the year can your force work on the roads?—A. About 11 months.

Q. (By Mr. LITCHMAN.) What do the convicts do in the other month?—A. That comes between times, and, in a way, they rest. We have probably 3 or 4 days or a week at a time that they are off. This last winter I do not think they laid off at all; there was work they could do all the time.

Q. (By Mr. A. L. HARRIS.) Would that obtain in the States where they have a colder winter?—A. No; unless you are quarrying; they could work in the quarries in cold weather.

Q. (By Mr. TOMPKINS.) You could do all your quarrying in the hard weather?—A. Yes.

Q. (By Mr. A. L. HARRIS.) You spoke of using field stone. Do you mean the ordinary boulder?—A. Yes.

Q. What is the character of that stone?—A. Some of it is very fair and some of it is not. We have to guard against it, and reject the softer grades.

Q. Is it granite, or cyanite, or bluestone?—A. The bluestone is the preferable, if we can get it. It is commonly known as "nigger head." We use a good deal of quartz, others to the contrary notwithstanding. Some people are very much surprised when I tell them we have some quartz roads standing up about as well as any others. I was over those roads last week and they are still wearing well.

Q. Have you any trouble in getting crushers that will stand the crushing of your field stone?—A. No.

Q. What crusher do you use?—A. We have two, the Champion and the Climax.

Q. (By Mr. TOMPKINS.) Where are they built?—A. The Champion is built in Pennsylvania, and the Climax at Marathon, N. Y.

Q. (By Mr. A. L. HARRIS.) How long will what is known as the jaw of the machine last in crushing stone?—A. That is owing a great deal to the quality of the stone. Sometimes it will crush 4,000 to 6,000 cubic yards.

Q. Have you any gravel beds?—A. No.

Q. No creek gravel?—A. No. We have some beds of decomposed granite.

Q. Then you depend altogether on decomposed stone?—A. You may say we depend upon crushed stone. If you use plenty of water you always get bonding material enough.

Q. How many convicts have you in your State?—A. I think there are some 1,200 in the penitentiary. I could not tell you how many are employed on the road.

Mr. TOMPKINS. This is a special kind of law, as I understand it. There are a number of counties that have that same law in regard to working convicts—Anson, Gaston, Forsyth, Guilford, Cabarrus.

Q. (By Mr. A. L. HARRIS.) How do you secure your convicts by night?—A. They are secured by chain. There is a long rod that goes through the quarters, and the chain is slipped over this rod.

Q. Would the character of camp that you describe be sufficient protection in a colder climate?—A. By the use of stoves, yes. With them you could get any heat you wanted.

Q. (By Mr. TOMPKINS.) How many convicts are at work in a county?—A. About 75 at each camp; that is about the average.

Q. How many camps?—A. Two out of 15 is about the average.

Q. How many convicts go from your county to the penitentiary at the discretion of the judge?—A. I suppose the number would probably average 4 a year.

Q. Those are for grave or very grave offenses?—A. Very grave offenses.

Q. The convicts are sent to work in the counties by the judges instead of sending them to the penitentiary?—A. Yes.

Q. (By Mr. KENNEDY.) Is there any belief that the judge gives longer sentences because of the use the county makes of the convicts than he would if they were sent to the State penitentiary?—A. No.

Q. (By Mr. FARQUHAR.) Does the county utilize the convicts in any other way than in road making?—A. No.

Q. (By Mr. A. L. HARRIS.) Do the white men and the colored men receive the same sentences for the same offenses?—A. Yes. In the county of Gaston their convicts are about half and half.

Q. In the use of your steam roller in making your road do you roll more than one time? Do you roll before you build the surface or after?—A. We roll each layer separately.

Q. How many layers do you put on?—A. Three layers. We roll the first layer, then go over it and fill up the depressions that may occur there until we get a true surface. Then we put on the stone and roll that until we get an even surface.

Q. I see in your paper you describe the kind of stone you put on for the first course. Is the ordinary macadam preferable to what is known as the Telford system?—A. I rather think that it is, though I can't say positively, because I have never seen what I consider a genuine Telford road.

Q. When you repair your roads what preparation do you put on before you put on the coat of stone?—A. The first work done in repairing is to fill the holes and all ruts with 1½-inch stone, fill this up, then probably put a little bit in, and then the roller going over with spikes will crush this stone down and level it up.

Q. How long are those spikes?—A. They are about 3½ to 4 inches. They roll down to 1½.

Q. This is a machine especially made for the purpose?—A. Yes. The spike is about 4 inches long, and at the point I suppose it is 1 inch or 1½. It tapers.

Q. Do you put the spikes in and use the same machine for rolling?—A. Yes. There are holes punched in the rim of the larger roller; 52 spikes; 26 to each roller. They are about 18 inches apart.

Q. Then, after you go over with your spike roller what do you do?—A. That we follow with the harrow. That loosens up everything and allows the road machine to level up all that is loose and get it in proper shape.

Q. The road machine is a scraper?—A. Road scraper.

Q. That makes the roadbed then perfectly level?—A. True.

Q. Then, how much macadam do you apply for the roadbed, as a rule?—A. About 4 inches, we strive to get it.

Q. What size stone is used in that?—A. That is 1½ inches. Then we put binding material upon that.

Q. Then you roll it thoroughly again?—A. Roll it thoroughly again, yes, as in the first instance.

Q. When complete, what impression does an ordinary road wagon have passing over it?—A. It has none.

Q. (By Mr. TOMPKINS.) This large roller is heavier and has more effect in packing the stone than the wagon would have in undoing the work?—A. Very much more. We have there a pressure of about from 500 to 700 pounds per lineal inch on the macadam, while on the ordinary wagon I suppose you would not have over 40.

Q. (By Mr. LITCHMAN.) Is there any difference by reason of the width of the roller as compared with the tire of the wagon?—A. Yes.

Q. Then the narrow tire would cut into the road more than a wide roller, even if there is a difference in weight, would it not?—A. The difference is in the weight. If you had anything like the weight on a narrow tire you could force it in.

Q. (By Mr. A. L. HARRIS.) Is it possible, in your judgment, to make a good road without a roller?—A. No.

Q. Is it economical to make a macadam road without a roller?—A. No; it is not.

Q. (By Mr. TOMPKINS.) Is it possible to do it with a little roller?—A. I do not think it is. I have seen it attempted, and I do not think it is.

Q. (By Mr. A. L. HARRIS.) If you had \$50,000 to apply upon a road, would it be advisable to purchase a roller so as to leave your road in a good condition when you were through?—A. Yes. We did not buy a complete outfit. We bought a roller and mounted a crusher, and we used the roller for driving the crusher.

Q. (By Mr. TOMPKINS.) The roller is a steam roller with a steam engine on it?—A. Yes.

Q. (By Mr. A. L. HARRIS.) Is it satisfactory?—A. We have used it for 5 years, and it is satisfactory; but if you have a good deal of road to build you would have employment for the roller all the time.

Q. But if you are building a small quantity of road you could utilize the machine for the two purposes?—A. Yes.

Q. Is the interest in good roads increasing in your State?—A. I think so, judging from the legislation.

Q. Is it increasing among the farmers?—A. Yes; I think so.

Q. Are they now generally disposed to do a good, fair day's work when they have an opportunity of working upon a neighborhood road?—A. We have had some of them offer to come and help if we would do so and so, but we do not think any of them want to do more than they have to do.

Q. (By Mr. TOMPKINS.) Do you work people that way any more?—A. No.

Q. All people are employed and paid?—A. Yes; every man is required to work 2 days in a township or pay \$1, and we collect, I suppose, about 50 per cent of that.

Q. You do not get any work from the others?—A. Yes; we do.

Q. (By Mr. A. L. HARRIS.) Are any of your roads built by public contract?—A. No.

Q. (By Mr. TOMPKINS.) If these bonds should accrue, how would the roads be built—by contract?—A. I think a good deal would be done by contract; that is the plan at present.

Q. (By Mr. FARQUHAR.) How many other counties have adopted this system?—A. I think there are some 15 or 20 in the State.

Q. (By Mr. TOMPKINS.) How many counties are there in the State—over 100, are there not?—A. Somewhere about 90.

Q. Do you know how many counties have utilized convicts on this work?—A. I do not.

Q. How many years since Mecklenburg County started this road system?—A. It commenced some 12 years ago.

Q. Was the agitation for good roads started in the city or in the country?—A. The first bill was introduced by S. B. Alexander. It became a law, but it was repealed by the next legislature. Then the second legislature following reenacted another bill, introduced by Mr. Adry.

Q. (By Mr. FARQUHAR.) Each succeeding year this system has increased?—A. For the last 8 years it has increased. It was at a standstill for quite a number of years; there was very little done.

Q. In the presentation of the question before your legislature, was the argument mostly that it was a saving to the State in the utilization of these convicts in the labor on the road, or was it on the ground that it was in the interest of a better commercial and industrial system to make better roads for the State? Which argument held?—A. Well, I could not tell you that, because it is so far back; but my recollection is that it was urged that it would be economy to the county to use the convicts in that way.

Q. They had to keep the convicts, and expected in that way to utilize them in building roads?—A. Instead of sending convicts to the penitentiary, the county was taxed with all costs and got nothing back, because any income from them went to the State.

Q. (By Mr. A. L. HARRIS.) As I understand, your State doesn't pay for the prosecution or conviction of the convict?—A. No; each county bears all court expenses.

Q. (By Mr. TOMPKINS.) Then the motive was partly to get good roads and partly to get something in return for these expenses?—A. Yes.

Q. And good roads were the best they could get?—A. Yes.

Q. (By Mr. FARQUHAR.) In the care of these convicts in your camp do you have good police regulations?—A. A great many of the convicts are made "trusties" in a very short while and chains are taken off. Of course they are not allowed to go away from the camp. Most any day you are in town you may see two or three wagons driven by some negro, without any chains or anything, who could pull up and get out any time he saw fit.

Q. Is there any system of surveillance used over the men while at work other than that of the guard?—A. No.

Q. Is your trusty allowed to go around anywhere at night without a guard?—A. He must stay in the quarters, but he is not chained in any way.

Q. There is no Sunday labor?—A. None at all.

Q. Do you have any Sunday sermons—anything of that kind?—A. I think so; yes.

Q. (By Mr. TOMPKINS.) Is there much disposition amongst this organization of convicts to get away and resist the guards?—A. Very little.

Q. Are they much discontented because of the confinement?—A. They do not seem to be. That depends very largely upon the men in charge. If they get a man that is kind there is no trouble, but when they have a man that they can take liberties with they keep crowding him up. I only know of one case where they had an insurrection and made a break, and that has been 10 years ago.

Q. (By Mr. TOMPKINS.) Was there very much trouble about quieting that?—A. No; I think they shot a couple of them, and maybe a couple of others got away. The others were put back to work.

Q. Did they change superintendents—anything of that sort?—A. I think not at that time.

Q. Have they changed superintendents for inability to handle the men?—A. I think they have—two or three times.

Q. (By Mr. FARQUHAR.) In the transfer of work of convicts from one county to another, what is the rate of compensation to the county?—A. I think in some instances they pay probably half the cost, possibly all the cost of the trial. It is owing to the length of time, a good deal, as to what they will pay. Sometimes it is a fixed charge; they pay so much for a year or a two years' sentence.

Q. (By Mr. TOMPKINS.) The county that uses the convicts always pays all the expense of keeping?—A. Yes.

Q. (By Mr. FARQUHAR.) What I desire to know is if there is any compensation?—A. Of course the county working the convict would have to pay the keep anyway, and the question would be what return is there for the county that rents the convict?

Q. (By Mr. TOMPKINS.) There is compensation, is there not?—A. In some cases I think there is. The county lets the convict out and gets rid of the keep.

Q. And for how long terms?—A. I do not know. It is some small compensation I do not know how much.

(Testimony closed.)

WASHINGTON, D. C., June 11, 1901.

TESTIMONY OF MR. ELWOOD MEAD,*Expert in Charge of Irrigation Investigations, Department of Agriculture.*

The commission met at 11.02 a. m., Vice-Chairman Phillips presiding. At 4.20 p. m., Mr. Elwood Mead, irrigation expert, Department of Agriculture, appeared as a witness and, being duly sworn, testified as follows:

Q. (By Mr. A. L. HARRIS.) You will please give your full name, post-office address, and your occupation.—A. Elwood Mead; I am irrigation expert in charge of the irrigation investigations of the Department of Agriculture.

Q. What State are you a native of?—A. Born in Indiana. For the past 18 years I have lived in Colorado and Wyoming; for the past 12 years, Wyoming.

Q. How long have you made this subject of irrigation a study?—A. Eighteen years.

Q. How long have you been with the Agricultural Department?—A. Three years.

Q. Have you studied the subject of irrigation in connection with agriculture in the various States of the West, and I might say of the East also?—A. I have.

Q. Have you a written statement that you desire to present to the commission?—

A. If you desire I will give an outline of my connection with irrigation. I went from Indiana to Colorado in 1882 to accept a professorship in the State Agricultural College. Four years later I became the professor of irrigation engineering in that college, being the first professor of this branch of engineering in this country. Between the time of going to Colorado and my acceptance of the last-named professorship, I was employed during two summer vacations by the State engineer of Colorado to make official measurements of the capacities of the irrigation ditches of the State having adjudicated rights to water. Colorado was the first of the arid States to assume public control over the diversion of water from streams. One of the first necessities of the legislation providing for this control was a table showing the capacities of the different ditches in use, and the measurements made to ascertain these capacities were the first of such measurements made. After 2 years of employment by the State engineer during the summer months I became assistant State engineer, resigning from the college, but returning to it when a school of irrigation was created there. In 1888 I became territorial engineer of Wyoming and continued in that capacity until 1898. In 1897 I became connected with the irrigation investigations of the Department of Agriculture and for the past 3 years I have been in charge of these investigations.

Q. Have you written a number of reports that have been issued by the Agricultural Department?—A. Since coming to the Department I have had charge of the bulletins issued by the Department with reference to irrigation, of which the following is a list:

Publications of the Office of Experiment Stations on irrigation.

- Bul. 58: Water Rights on the Missouri River and its Tributaries. By Elwood Mead. Pp. 80.
- Bul. 60: Abstract of Laws for Acquiring Titles to Water from the Missouri River and its Tributaries, with the Legal Forms in Use. Compiled by Elwood Mead. Pp. 77.
- Bul. 70: Water-Right Problems of Bear River. By Clarence T. Johnston and Joseph A. Breckons. Pp. 40.
- Bul. 73: Irrigation in the Rocky Mountain States. By J. C. Ulrich. Pp. 64.
- Bul. 81: The Use of Water in Irrigation in Wyoming and its Relation to the Ownership and Distribution of the Natural Supply. By B. C. Buffum. Pp. 56.
- Bul. 86: The Use of Water in Irrigation. Report of investigations made in 1889 under the supervision of Elwood Mead, expert in charge, and C. T. Johnston, assistant. Pp. 253.
- Bul. 87: Irrigation in New Jersey. By Edward B. Voorhees. Pp. 40.
- Bul. 90: Irrigation in Hawaii. By Walter Maxwell. Pp. 48.
- Bul. 92: The Reservoir System of the Cache La Poudre Valley. By E. S. Nettleton. Pp. 48.
- Bul. 98: Irrigation Laws of the Northwest Territories of Canada and of Wyoming, with Discussion, by J. S. Dennis, Fred Bond, and J. M. Wilson.
- Bul. 100: Irrigation Investigations in California, under direction of Elwood Mead, assisted by William E. Smythe, Marsden Manson, J. M. Wilson, Frank Soulé, C. E. Grunsky, James D. Schnyler, and Edward M. Boggs.

Rise and Future of Irrigation in the United States. By Elwood Mead. Yearbook of Department of Agriculture for 1899. Pp. 25.

Now, if the commission desires I will take up and follow the general lines of the summary I sent you yesterday, and I will take up the questions that seem to me to be fundamental.

We are accustomed to think and speak of irrigation in the United States as being of recent development. Nothing could be farther from the truth. In many parts of the Southwest, notably in northern New Mexico and Arizona, there are well-defined remains of irrigation works which have outlived by many centuries the civilization to which they belonged. Near Las Cruces, N. Mex., is an irrigation ditch which has an unbroken record of over 300 years of service. The Spanish settlers along the Rio Grande were irrigating their gardens 70 years before the settlement at Jamestown. It is true, however, that irrigation by English-speaking people is only about 50 years old. For its beginnings we must go to Utah, where the little band of Mormon emigrants was compelled to adopt it to save themselves from starvation. It was 20 years after the beginnings in Utah that irrigation came to be an important factor in the growth and settlement of Colorado and California. It is an interesting fact that the earlier attempts in these 2 States where irrigation has assumed the greatest importance were made at the same time. The discovery of gold in California created the overland trail and opened the great interior valleys of the arid West to miners and stock raisers. At the stage stations bordering on streams and in the vicinity of mining camps men without any knowledge or experience built small, rude ditches and turned water on the thirsty soil. In every instance work was begun without apparent consideration of future necessities, and by men to whom the whole subject was strange and new. It is only by understanding this lack of direction and the haphazard methods which prevailed in the beginnings of our age that we can understand the present situation.

There are few countries in which irrigation is destined to assume greater importance than in the United States. Throughout nearly all that portion of the country west of the one hundredth meridian successful agriculture is not possible without it, while each year sees an increase in its use east of that meridian. Leaving out of consideration Alaska and the recently acquired insular possessions, in some of which irrigation is already an important factor, the area of the United States east of the one hundredth meridian is 1,618,830 square miles. West of that meridian there are 1,443,819 square miles. Taking this meridian as an approximate division of the humid and arid portions of the United States, they stand in a ratio of about 53 to 47. The humid portion is, however, somewhat larger than this. There is a narrow strip of well-watered territory along a part of the Pacific coast, and scattered throughout the arid region there are relatively small areas with a rainfall considerably above that of the surrounding country, and where crops can be grown without irrigation. Making the one hundredth meridian the eastern boundary of the arid region is also purely arbitrary. The decrease in moisture begins 500 miles east of the Rocky Mountains, and gradually but irregularly increases as they are approached. Taking into consideration these minor modifications of the rough division changes the percentage of humid to arid land to a ratio of about 60 to 40.

Within the limits of the arid region it is not too much to say that irrigation is the basis of civilized life. In many of the arid States the value of the crops grown by irrigation exceeds the output of the mine or the profits of the factory. Not only is this true, but the cheap and abundant food supply which irrigation has provided has made possible the operation of many mines and the development of important industries which would have been impossible if the food supplies of their operatives had all to be shipped in from the farms of the humid East. The influence which irrigation has exerted in beautifying the landscapes of the watered areas of the arid West, in lessening the dust and discomfort, and rendering life more healthful and attractive, must not be lost sight of. The oases of fruit and foliage and the marvelous beauty of the gardens and orchards of southern California have done as much to fill the transcontinental trains from the East with health and pleasure seekers as has the healthful and enjoyable climate of that region. Nor does this statement apply to California any more than to the business centers of the other arid States. The cities of Phoenix, Reno, Boise, Salt Lake, and Denver are almost as much the creation of irrigation as the farms and orchards which surround them.

Irrigation in the United States differs from irrigation in nearly all other irrigated countries in one important particular. In Italy, France, Egypt, India, and even in

Australia, many of the important irrigation works have been built by the Government and owned and protected as public works. In the United States, on the other hand, every canal in operation and, with one or two exceptions, every reservoir used in irrigation is owned and protected as private works. Neither the several States nor the general Government have as yet entered into the work of ditch or reservoir building. Colorado has built 2 or 3 reservoirs with State funds and begun 1 canal, but outside of this, investments of \$200,000,000 or more to provide water for the cultivated lands of the arid West have come from private funds. Whatever has been done in the way of overcoming physical obstacles, the building of dams to control mountain torrents, the aqueducts which follow the precipitous sides of mountain canyons, the thousands of smaller ditches, and the hundreds of important canals, together with the immense outlay of money and toil required to put arid land in condition for the distribution of water, have all come as the result of the outlay and effort of individual companies and corporations.

Owing to the fact that this development has been left to private enterprises, there has been a delay in the enactment of laws required to protect irrigation investments and to secure to the water user his proper share of the stream along which he lives. In countries where canals are built with public funds, adequate laws for governing the division of a stream which fills them receive early attention, and the leading consideration in the location of these public works is a conservation of the water supply and its use on the best land. In the United States, on the contrary, the building of ditches and the reclaiming of land being a private matter, public considerations have received but little attention in the location of works or in the enactment of laws to determine rights to streams. The amount of money which the individual company projecting irrigation works had was the controlling consideration in the location of canals and ditches. As a rule, the places where ditches could be built at the least cost were first selected. Where these favorable locations have been utilized, then larger and costlier works have been undertaken. And after the natural flow of streams has been absorbed, there has followed a natural construction of reservoirs to store the flood waters and the waters which run to waste during the season when water is not required in irrigation. In States having a favorable climate, like California, or people of exceptional enterprise, as in Colorado, or where there has been from the first a large local demand for farm products, owing to the proximity of mines, irrigation has developed more rapidly than in States where the demand for irrigated products or the price received for them has not been so favorable. Utah has more cultivated land than Montana, although the area susceptible of irrigation in Montana is many times that of Utah.

It is probable that if canals had been built as public works the leading consideration would have been an abundance of water supply, but being private works the leading consideration has been the cheapness with which ditches could be built and the profit with which the rights in these ditches could be disposed of. Because of this there are many streams in the West where the natural flow has already been fully utilized. The ditches and canals, which take water from the Arkansas River in Colorado and Kansas, cover more land than the stream can be made to irrigate if every available reservoir site along the stream is improved, and all the water which can be utilized. The canals which divert the South Platte River in Colorado and Nebraska cover all the land which that stream can be made to irrigate. On hundreds of streams in the various arid States and Territories the capacity of the canals and ditches already built is fully equal to the water supply. In some cases there are more ditches than can be filled, and the people who depend on them suffer from drought as severely as do the people who depend on rain. As a rule, all the land which can be cheaply irrigated is now either being irrigated or is owned by parties who intend to irrigate it, and the streams which can be easily diverted will require reservoirs to make a further extension of the cultivated area safe and profitable; nevertheless, there is a great field for future development. The large rivers of the arid region like the Missouri, Big Horn, Snake, Rio Grande, Green, and Sacramento are as yet almost undiminished in flow. The reason for this is that the cost of works to utilize them has been too great. In many cases this cost will for years to come be beyond the reach of private enterprise or beyond the hope of any profitable return if undertaken as private enterprises, and this is one of the reasons why State or national aid is regarded as a necessity, or if not a necessity, as a wise public policy for the country to adopt.

Wherever irrigation is necessary, laws for the regulation and control of streams must be enacted if development is to be peaceful and prosperous. It is just as necessary for the farmer to know who owns the water he uses as it is for him to know that he has title to the land that he cultivates. In the arid region of the United States the character of titles to water has an especial importance, because of the scarcity of the supply. With very few exceptions, there is more irrigable land along the river than the stream will serve. Hence, whoever controls the stream practically controls the land on which it is used, because he can dictate what land shall be made productive and what land must remain forever arid and almost worthless.

SEPARATE.

Rise and Future of Irrigation in the United States. By Elwood Mead. Yearbook of Department of Agriculture for 1899. Pp. 25.

Now, if the commission desires I will take up and follow the general lines of the summary I sent you yesterday, and I will take up the questions that seem to me to be fundamental.

We are accustomed to think and speak of irrigation in the United States as being of recent development. Nothing could be farther from the truth. In many parts of the Southwest, notably in northern New Mexico and Arizona, there are well-defined remains of irrigation works which have outlived by many centuries the civilization to which they belonged. Near Las Cruces, N. Mex., is an irrigation ditch which has an unbroken record of over 300 years of service. The Spanish settlers along the Rio Grande were irrigating their gardens 70 years before the settlement at Jamestown. It is true, however, that irrigation by English-speaking people is only about 50 years old. For its beginnings we must go to Utah, where the little band of Mormon emigrants was compelled to adopt it to save themselves from starvation. It was 20 years after the beginnings in Utah that irrigation came to be an important factor in the growth and settlement of Colorado and California. It is an interesting fact that the earlier attempts in these 2 States where irrigation has assumed the greatest importance were made at the same time. The discovery of gold in California created the overland trail and opened the great interior valleys of the arid West to miners and stock raisers. At the stage stations bordering on streams and in the vicinity of mining camps men without any knowledge or experience built small, rude ditches and turned water on the thirsty soil. In every instance work was begun without apparent consideration of future necessities, and by men to whom the whole subject was strange and new. It is only by understanding this lack of direction and the haphazard methods which prevailed in the beginnings of our age that we can understand the present situation.

There are few countries in which irrigation is destined to assume greater importance than in the United States. Throughout nearly all that portion of the country west of the one hundredth meridian successful agriculture is not possible without it, while each year sees an increase in its use east of that meridian. Leaving out of consideration Alaska and the recently acquired insular possessions, in some of which irrigation is already an important factor, the area of the United States east of the one hundredth meridian is 1,618,830 square miles. West of that meridian there are 1,443,819 square miles. Taking this meridian as an approximate division of the humid and arid portions of the United States, they stand in a ratio of about 53 to 47. The humid portion is, however, somewhat larger than this. There is a narrow strip of well-watered territory along a part of the Pacific coast, and scattered throughout the arid region there are relatively small areas with a rainfall considerably above that of the surrounding country, and where crops can be grown without irrigation. Making the one hundredth meridian the eastern boundary of the arid region is also purely arbitrary. The decrease in moisture begins 500 miles east of the Rocky Mountains, and gradually but irregularly increases as they are approached. Taking into consideration these minor modifications of the rough division changes the percentage of humid to arid land to a ratio of about 60 to 40.

Within the limits of the arid region it is not too much to say that irrigation is the basis of civilized life. In many of the arid States the value of the crops grown by irrigation exceeds the output of the mine or the profits of the factory. Not only is this true, but the cheap and abundant food supply which irrigation has provided has made possible the operation of many mines and the development of important industries which would have been impossible if the food supplies of their operatives had all to be shipped in from the farms of the humid East. The influence which irrigation has exerted in beautifying the landscapes of the watered areas of the arid West, in lessening the dust and discomfort, and rendering life more healthful and attractive, must not be lost sight of. The oases of fruit and foliage and the marvelous beauty of the gardens and orchards of southern California have done as much to fill the transcontinental trains from the East with health and pleasure seekers as has the healthful and enjoyable climate of that region. Nor does this statement apply to California any more than to the business centers of the other arid States. The cities of Phoenix, Reno, Boise, Salt Lake, and Denver are almost as much the creation of irrigation as the farms and orchards which surround them.

Irrigation in the United States differs from irrigation in nearly all other irrigated countries in one important particular. In Italy, France, Egypt, India, and even in

diverts it, the tendency is to favor the union of land and water. But on many streams corporations have built large and costly works in advance of settlement to supply lands they did not own and never expected to own. Under such conditions the natural tendency has been to favor a doctrine which would make the owners of the works the appropriators of the stream and to give them the greatest possible freedom in disposing of the water supply to users when the lands below the canal were brought under cultivation.

Another troublesome problem in many of the Western States has grown out of the conflict between the rights of appropriators of water under State laws and the rights of riparian proprietors, as recognized by State constitutions. In Colorado, Wyoming, Montana, Idaho, Utah, Nevada, and in the Territories of New Mexico and Arizona, riparian rights have been abrogated, but in California, Washington, Oregon, the two Dakotas, and Nebraska the constitution recognizes the common-law doctrine of riparian rights, which requires that streams must flow undiminished in volume. Later on these States have passed laws which permit irrigators to appropriate and divert the entire supply until it is an open question which of these two conflicting policies is to prevail. It will hardly be wise for either the State or General Government to extend any considerable aid, while whatever is done by private enterprise will be attended by so much hazard as to make development comparatively slow and uncertain.

For several years past none of the arid States has had a more rapid growth than Nebraska. Many large canals have been built, and a large acreage of land in the western part of the State brought under cultivation. This was due in part to favoring natural conditions, but more largely to a very excellent law providing for the systematic record of water appropriators' rights, and their legal recognition when the water had been used. All this has been changed by a recent decision of the supreme court, declaring the common-law doctrine of riparian rights to be the law in that State. If this is true, then every diversion of water is illegal. No one knows what is to be the result. Irrigators are fearful and investors in canals greatly alarmed. There seems to be reason for this feeling, as the millers of Nebraska, some 50 in number, at their meeting last week, perfected an organization under which they are to institute lawsuits to enforce the recent decision of the supreme court, and close up the irrigation canals that are depleting the streams.

In Kansas the statute law recognizes the doctrine of riparian rights east of the ninety-seventh meridian, and the doctrine of appropriation west of it. This seems to be a sensible arrangement, although it sounds rather arbitrary to say that west of an imaginary line all the water of a river may be used, while a few feet away to the east of it none may be diverted.

Next in importance to the nature of a water right is the method by which it is established. To Colorado is entitled the credit of passing the first law on this subject. It gives to each claimant of water the right to inaugurate in court a procedure, under which all claimants to the same supply can be compelled to come into court, and have the relative priorities and amounts adjudicated. After this has been done the Colorado law provides that the streams shall be under public control, and the State officer known as a water commissioner shall in times of scarcity divide the water among the holders of these adjudicated rights.

In many of the States and Territories there is no orderly procedure for the settlements of the rights of all irrigators to a stream at one time. In these States whenever the ditches at the head of a stream rob the ditches below, controversies are sure to arise. If the irrigators below are lawless or impulsive, raids to tear out the dams and head gates above are likely to result. But among law-abiding water users the only remedy is an appeal to the courts, which stand as the sole tribunal between injustice and violence. The objection to this court litigation is that it is exceedingly costly and apparently unending. A lawsuit of one ditch owner against another may settle the issues between those two parties, but it can not be made to apply to the ditch owners and irrigators not made a party to the suit. It too often happens, therefore, that litigation, instead of settling controversies, only serves to create new issues, which, in turn, have to be litigated. In one case in California "A" brought suit against "B," and was decreed to have the first right to the water of a stream, and "B" was enjoined from interfering with "A's" use of the river. "B" then brought suit against "C," and was declared to have a better right than "C," and "C" was enjoined from interfering with "B's" enjoyment of the stream. Then there was trouble for "C." He saw there were no superior rights to his, and he made adequate preparation and gathered his witnesses and all the information he could and brought suit against "A," while "A," relying upon the fact that there had been two judgments in his favor already, put up a weak defense, and "C" was decreed to have a superior right to "A," and "A" was enjoined from interfering with "C's" use of the river, and all parties were back at the beginning again. That is not an isolated instance; on the contrary, it is a typical instance of the litigation over water.

It can scarcely be doubted that there should have been provided at the outset some orderly tribunal which would have managed and disposed of the water of streams, as the General Government has surveyed, cared for, and disposed of the public lands. If that had been done, records of claims and appropriations would have been complete and accurate, and the danger which now threatens us of excessive and speculative appropriations would have been averted without injury to anyone, and with less cost in administration than has been necessary to carry on the litigation in the courts. The experience of Wyoming with such a tribunal has fully supported this conclusion. In Wyoming the waters of streams are public property. This property is managed by special tribunal. Every intending user of water must secure from this tribunal a permit. Where all of the water of a stream is appropriated, permits are refused, because additional ditches would not mean the cultivation of more land, while they might mean controversy with other ditches or lessening the rightful water supply of prior appropriators. This law has been in force for 10 years. Under it the rights of over 4,000 appropriators have been established without litigation or controversy, and these rights are recognized as having nearly the same stability as patents to public land.

This is a brief and imperfect outline of the methods by which the streams used in irrigation have been appropriated and the rights to their waters established, but the term "water right" has also another meaning. Many of the appropriations to large ditches and canals carry volumes of water sufficient to irrigate anywhere from 100 to 500 farms. The owners of farms along these canals purchase from the holder of the appropriation what is also called a water right. The limitations of the water right of the canal owner are fixed by law, while the limitations of the water right of the irrigator are fixed by the terms of his contract with the canal owner. As a rule, the two water rights have no resemblance to each other. The right of the canal owner gives him a continuous flow of the volume appropriated, with the right to dispose of it to whomsoever he pleases, and with no restrictions as to the means of diversion or place of use. The water-right contract under which irrigators usually obtain their supply only gives them a right to water during the irrigation season. This right is not to a continuous flow, but is to vary with the irrigators' necessities. Instead of the place of diversion and use being unrestricted, both are defined in the contract. If the commission desires it I will submit a number of blank water-right contracts of the form used by ditch companies in disposing of water for irrigation, as they illustrate the conditions which govern the growing commerce in water.

Q. (By Mr. PHILLIPS.) Are there different contracts in different States?—A. Yes; the irrigation investigation of the Department of Agriculture has about 500 of these contracts altogether.

Q. All different kinds of contracts?—A. They are all contracts of different companies, but a majority of them are essentially alike in their conditions. Out of this collection I will submit to you a half dozen or more. These contracts fix the conditions of the traffic in water, the conditions on which the users receive it, and its value. Decrees give the water to the canals, and the canals sell the water represented by those decrees. Some of the contracts are of a dual nature; they provide a charge for the right to the water itself, and also a charge for the service rendered in the delivery of the water by the company. Some of them are of a character that contemplates the eventual transfer of the works and of the appropriation to the purchasers of these contracts. Now, I will give some details regarding the prices of water rights. I will submit as samples of water-right contracts, 3 from Colorado, 1 from California, and 1 from New Mexico.¹

Q. (By Mr. LITCHMAN.) We would like some description at some point in your statement of the manner of constructing these ditches.—A. Permit me to submit the map in Bulletin 92, showing the canals taking water from the Poudre River, in Colorado. It will be seen by examining this map that each of these ditches receives water from the stream and in this way covers a considerable area of land between the canal and the river or between it and the canal next below. This is made possible by the topography of the country. The map shows a canal system east of the Rocky Mountains. From the eastern base of this range for nearly 500 miles the country has a slope varying from 25 feet to the mile near the foothills to 4 or 5 feet to the mile as it nears the Missouri River. Denver has an elevation of 5,250 feet above sea level. Omaha is nearly 4,000 feet lower. The intervening country is so free from hills or broken and irregular slopes that it would be possible to build a canal to reach from one city to the other and to water the intervening country, if there was water enough to supply it. In a general way the country slopes away from the base of the mountains, and canals can be built to take water from the streams as they flow away from the mountains and distribute by gravity over all of the country suited to irrigation. Bear River, in Utah, for a mile below the head of the Bear River Canal, has a fall of 120 feet. The canal in that distance has a fall of 4 feet. Hence the bed of the canal is 116

¹ The contracts referred to are on file with the commission. Two typical contracts are set out in full at the end of Mr. Mead's testimony as exhibits.

feet above the stream at the end of that distance, a sufficient elevation to permit of the watering of the plateau, embracing nearly 100,000 acres of land. The river shown in the map (the Poudre) has a fall of 25 feet to the mile, the canals shown have each a fall of about 2 feet to the mile, so that for each mile of canal through which the water passes there is a gain of 20 feet or more in elevation above the river. In using the water it is turned from these canals and ditches on the lower side and distributed by gravity over the fields below. The methods of distribution vary with different crops and in different sections of the country. Where crops are cultivated water is run down furrows. Furrow irrigation is now the method generally employed in the irrigation of orchards. Small grain, native and cultivated hay are usually irrigated by flooding, which means that the water is spread over the entire surface.

The map of the canals taking water from the Poudre shows by the different colors the area irrigated by each. The first of the larger ditches to be built has its irrigated area indicated by diagonal lines; the next is on the opposite side of the river. These two are the Greeley Colony canals, and they were built at the lower end of the stream because there were fewer obstacles there. Later the canals farther up the stream were built, and as they took more and more water from the stream they lessened the supply which ran down to the older ditches below.

In all of the West except southern California irrigation ditches and canals are unlined. The soil over which the water passes is expected to retain it in its channel; but there are cases where it fails to do this and the losses from seepage and percolation are excessive. Where canals cross strata of coarse gravel, or where there are gypsum deposits, the losses from this cause are very great. In one instance the measurements of the irrigation investigation of the Agricultural Department showed a loss in a canal of 75 per cent of its entire supply in a distance of less than a mile. The following, taken from the report of these investigations for 1899, shows the extent and character of these losses over a widely distributed area:

"In practice the losses in canals from percolation, leakage of flumes, evaporation, etc., are an important factor in fixing the average duty of water from a river or an extensive canal system. To determine this average duty the volume should be measured at the head gate, and the acres it irrigates is the duty which canal managers have to consider in determining the area their works will irrigate. This duty is much lower than that obtained by measurements made on laterals or at the margins of the fields where used, the influence of the losses between the head gate and the heads of laterals being greater than has usually been supposed. Where canals cross gravel beds or gypsum deposits the results closely resemble trying to carry water in a sieve. The following table gives the number of acre-feet used in the irrigation of an acre of land where the measurements were made at the canal head gates, and include the loss from seepage and evaporation:

Duty of water when losses in main canals are included.

Name of canal.	Acre-feet.
Pecos Canal, New Mexico.....	6.61
Mesa Canal, Arizona.....	3.81
Butler Ditch, Utah.....	6.24
Brown and Sanford Ditch, Utah.....	5.32
Upper Canal, Utah.....	6.30
Amity Canal, Colorado.....	4.92
Rust Lateral, Idaho.....	5.06
Average.....	5.47

"A comparison of the duties in the above table with those obtained when the water was measured where used will show that more than twice as many acre-feet were required where the water was measured at the head gate as where measured at the place of use; or, in other words, the losses in the canals from seepage and evaporation amount to more than one-half the entire supply. This is in accord with many of the measurements made on irrigation canals in India. Among those recorded in Buckley's Irrigation Works in India is one which shows that the irrigation of wheat under the Jamda Canal, in Bombay, required 5.6 acre-feet of water for each acre irrigated where the water was measured at the head of the canal, but where the water was measured at the place of use it required, in two experiments, only 2.1 acre-feet and 1.4 acre-feet to irrigate an acre, the loss in the canal being more than 50 per cent. On the Hathmati Canal, in the same country, the loss from the seepage and evaporation was 50 per cent. These losses in transit are much heavier than is the rule on the older canals of India, and are doubtless more general than they will be in this country when the banks of canals are older and when they are operated with greater regard for economy.

"The report of Mr. Reed (p. 109) shows that 47.7 per cent of the water turned in at the head of the Pecos Canal reached the consumers, while 52.3 per cent was lost through seepage and evaporation. The causes of this loss are explained to be the checking of the velocity in the canal by dams in order to throw water on ground too high to be irrigated without this, certain defects in construction, and the nature of the soil in which the canal is built. The canal has a bank on one side only. This has produced stagnant lakes and pools on the upper side wherever the canal crosses ravines or where the ground on the upper side is so low that the water overflows it when the canal is filled. Mr. Reed's report also shows the variation in rate of seepage due to the character of the soil, three-fourths of the water entering one section of the canal 1 mile long being lost. To his summary of the causes of the great loss of water there may be added the fact that the water used in this canal is taken from the reservoirs. Its temperature is already above that of most mountain streams, which facilitates alike its rapid filtration and evaporation. It is perfectly clear, owing to the fact that all of the sediment carried by the river is deposited in the reservoirs. This canal affords an illustration of a lower duty on a particular farm, measuring the water at its margin, than the average under the main canal, measuring the water near the head gates. Mr. Reed points out the causes for this, and shows that it does not illustrate the necessities of irrigation, but the possibilities of waste under encouraging conditions.

"The water taken into the Mesa Canal during the 4 years that measurements have been made has varied from enough to cover land to a depth of 5.9 feet in 1896 to 3.8 feet in 1899. A measurement was made in 1899 of the water used on a farm where the land had not before been irrigated and where more than the average amount of water was required. Owing to the fact that rotation was practiced on the lateral leading to this farm, it is impossible to determine the exact quantity lost in passing through it, but the water delivered at its head for this farmer would have covered the land to a depth of only 2.8 feet. The difference between the average depth under the main canal and the depth of water used on this farm was just 1 foot, or a difference in quantity of 1 acre foot per acre irrigated. Mr. Code estimates that this difference would have been much larger if the loss in transit through the lateral had been determined. As it is, this shows a loss of over 25 per cent.

"The construction of the Gage Canal is such as to make losses through seepage practically nothing, owing to the canal being cemented. The loss from evaporation is also small, because the canal is deep and narrow and has throughout its length a uniform cross section, with no pools of still water on the upper side. As compared to losses varying from 25 to 75 per cent shown in other canals, the loss of only 6 per cent in this canal has great significance. The water turned into the head would have served to cover the land irrigated to a depth of 2.24 feet, while the mean depth for the water delivered to irrigators' laterals was 2.11 feet, a loss of only 0.13 of an acre-foot per acre irrigated. Canals can only be cemented on earth, as is done in California, in localities where frosts in winter are not severe. There are other remedial measures which can be employed in other sections which will, no doubt, be largely adopted when the extent of the loss from this source is more generally realized. Dumping clay into the canal and causing it to be distributed by agitating the water has been tried with good results on some Nebraska ditches.

"The report of the careful and interesting investigations of Professor Fortier at the Montana Agricultural Experiment Station shows that in the Middle Creek Canal nearly 22 per cent of the total flow was lost in seepage in the first 4 miles, while the probable loss in the entire canal was 35 per cent. The conclusions of Professor Fortier are in accord with those of other observers as to both the evils resulting from this loss and the methods by which it may be reduced.

"The water taken into Logan and Richmond Canal would cover the entire area it irrigates to a depth of 3.59 feet. The water actually used on the Cronquist farm would have covered it to a depth of only 2.6 feet, the difference between the average duty under the canal and the measured duty on one farm under it being nearly 1 acre-foot of water for each acre irrigated, or a difference of about 28 per cent. It is believed that this can be fairly taken as the loss resulting from the seepage and evaporation in carriage.

"The water entering the head gate of the Amity Canal in Colorado would have served to cover all the land irrigated to a depth of 4.92 feet. The water delivered from the Biles lateral would have covered the land under that lateral to a depth of only 1.82 feet. The difference between the average duty under the canal and the special duty under one lateral is 63 per cent. This seems to indicate that more than one-half of the water taken from the river disappears before it reaches the place of use. An examination of the map of the Amity Canal (Pl. XII, p. 100) will show the reason for this excessive loss. The canal is a large, long one and much of the time last season was only partly filled. More than one-half of the time the water flowing through it was spread out in a broad, thin sheet, which reduced its velocity and gave abundant opportunity for the continuous sunshine to raise the temperature. This increase in temperature facilitated both its disappearance in the air and its filtra-

tion through the soil. Mr Berry's report shows that the season of 1899 was unusually windy, making evaporation greater than usual.

"Enough water was taken into canal No. 2 at Wheatland, Wyo., to have covered all the land irrigated to a depth of 2.53 feet, while only enough water was delivered through the J lateral of that canal to cover the two fields on which the water used in irrigation was measured to a depth respectively of 0.7 and 1.55 feet, the apparent loss in the canal being one-half the water entering it. In this case this high rate of loss is what might have been expected. The canal is long. It traverses a steep hill-side slope for 2 miles, in which distance the loss under the lower bank is excessive. In many places the bottom is gravel, through which water escapes freely.

"In order to more carefully study the variations in these losses, arrangements were made early last season by Frank C. Kelsey, city engineer of Salt Lake City, Utah, to measure the seepage loss from the Jordan and Salt Lake Canal from the Jordan River. This canal is 29 miles long, with a bottom width of 20 feet. It originally had a grade of 2 feet per mile, but when measured was in bad condition, with a flow of 30 cubic feet per second at the head. The loss in 29 miles was 45 per cent.

"The losses from seepage in new canals are excessive. For the past 6 months 500 inches of water have been flowing in at the head of a 10-mile lateral built at Billings, Mont., in 1899, but as yet not a drop has reached the lower end. On a canal built in Salt River Valley, Wyoming, there was a loss in 1896 of 10 cubic feet per second in a distance of 100 feet, which continued for several weeks with no apparent prospect of the loss diminishing. This was about one-third of the canal's flow. The canal was then abandoned. The canals which take water from the North Platte River are all subject to excessive losses when first built, because of the sandy soil through which they must pass. In high water, however, this river is heavily charged with a white clay, due to the erosion of its banks. When this is deposited on the sides and bottom of ditches it forms a coating only less impervious than cement, and after a few weeks' operation during high water seepage losses always show great diminution.

"Mr. Code reports that the water of Salt River, Arizona, contains a cementing material which in time renders its banks almost water-tight so long as they remain undisturbed. This has not heretofore been possible on the Mesa Canal, because it has been undergoing constant repairs and improvements."

Q. (By Mr. A. L. HARRIS.) Does that seepage come to the surface below on ground that may be used for crops?—A. Yes. The loss of water by seepage is not only a serious problem with canal owners, but frequently becomes the cause of grave injury to the farming lands below. The water which escapes through the bottom of the canal follows the path of least resistance, and this sometimes takes it into the channel of the river or causes the appearance of springs in ravines which before were dry, or it may lead it to reappear in the fields below, often converting them into marshes and swamps. Instances are not infrequent where thousands of acres of land have for a time been rendered valueless from this cause. The saturation of the subsoil and the gradual rise of the water level nearly always attend irrigation. The first wells dug in the San Joaquin Valley in California were 60 to 70 feet deep. Since then the water has risen in many of these wells to within 4 or 5 feet of the surface.

Where seepage is not excessive it furnishes an inexpensive method of irrigation; where it is it may cause a double injury. It prevents the growth of crops because of too much water and renders the soil unproductive through the accumulation of alkali which it causes. Water passing from canals through the subsoil dissolves the soluble salts which all Western lands contain in greater or less measure, and the subsequent evaporation of this alkali-impregnated water so increases the percentage of alkali in the lower lands as to prevent the growth of crops. This evil is not, however, destined to be a permanent one, and, like the excessive moisture, can be remedied by drainage.

Q. (By Mr. FARQUHAR.) In Colorado and Wyoming is the general characteristic of your streams seepage or are they on solid ground and solid bottom?—A. In both of those two States, as a rule, the losses are not excessive in canals. There are exceptions, of course, but in both eastern Colorado and eastern Wyoming the soil is of a character to hold water pretty well, although in the older districts in Colorado there is a considerable area of land in the low bottoms along the streams that has become supersaturated both with water and alkali. This is not altogether due to losses from ditches. Probably the greater part comes from putting too much water on the fields. It is rather a drainage from the area irrigated.

Q. The characteristics of the Arkansas from its source north of Leadville to its reaching the Mississippi has usually been characterized as a river of seepage. Anywhere along the banks by digging a few feet down you reach a well. Is it not a fact that that river itself, in its whole course, a good part of it, is really below the surface?—A. All of the rivers that flow out on the plains sink into the sand of their bed. I did not take your question as applying to the rivers, but rather to the ditches.

Q. The point was this, that many of the foothill streams east of the mountains—

would not the seepage be generally supposed to amount to a great deal or do much harm, but when you come to a river like the Arkansas, with a large body of water passing over plains with very little fall, the water itself is drawn out and distributed a good deal in the banks and surrounding low ground?—A. That is true of all the streams flowing from the Rocky Mountains out on the plains. It is a characteristic of the Rio Grande, of the Arkansas, the South Platte, and the North Platte. The North Platte has been measured 100 miles west of the Wyoming border and found to carry 400 cubic feet per second, while a few miles east of the Nebraska and Wyoming border it was entirely dry. The entire 400 cubic feet per second had sunk into the sand.

Q. Have you anything to say about the filling up of these canals with silt and other substances that are quite expensive in canalizing?—A. The canals taken out of the lower portion of those streams running out on the plains are more or less troubled by the moving sands in the bottom of the stream that tend to fill them up; and all canals that are taken out of rivers that carry considerable quantities of mud in high waters have to be cleaned out every year. The deposits of mud can be handled as a rule without any excessive expense, but in streams like the North and South Platte and the lower part of the Arkansas the sand question is quite troublesome; and on the lower part of the Rio Grande the question of mud becomes an important factor. The red rise in the Rio Grande occurs when there are torrential rains along certain portions of the river where there is a red soil, and enormous volumes of mud are washed down in the river; samples of the stream taken at that time have shown as high as 17 per cent of solid matter. All the ditches have to be closed during the time of the red rise because they would immediately fill up.

At Las Cruces, N. Mex., is one of the oldest ditches, if not the oldest ditch, in the United States. That ditch was formerly a channel cut below the surface of the ground. Now it is raised 4 or 5 feet above the surface of the ground. As the mud which was carried into the ditch was cleaned out each year it was thrown on the banks; and when the banks became so high as to be troublesome they simply let the mud fill up a foot or so in the bottom. In time the ditch got above the stream, and they had to move the head farther upstream. In the period of operation of that canal the head has been moved upstream 3 or 4 miles from the original location. Not only that, but since the time the irrigation began the level of the soil on which the water and mud has been spread has been raised from a few inches to 2 feet—higher, of course, nearer the ditch, and becoming thinner and thinner as you recede from it. The Rio Grande at El Paso has filled up its channel from this cause until the river itself is higher than some of the streets of either El Paso or Juarez.

Q. (By Mr. A. L. HARRIS.) Has there been any conflict between irrigators on account of priority of rights?—A. In recent years litigation and controversy over the division of water has been alike a conspicuous and injurious feature of our irrigated agriculture. It has been due to two causes. The first is the lack of any plan for the establishment of rights to a stream, or public protection of those rights. When the men along the lower end of a stream see its waters shrink and their crops burning up for the lack of water they realize that it is due, not to the absence of the snow in the mountains, but to the fact that later ditches above them are robbing them of their just share. Before the farmers will permit the loss of their year's labor from this cause they will resort to almost any expedient to obtain what they believe belongs to them, and so they organize raids to tear out the dams above or go into court to obtain legal redress. The remedy for this is to have water divided under public control. In the 4 States where this has been done irrigators are far more contented and controversies far less numerous and injurious than where no such control has been exercised. The second reason for controversies has grown out of the mistakes made in the adjudication of rights to streams. In the study of the water-right problems of California recently completed there were claims for 28,630,932 inches from a stream which can not be relied upon to furnish 10,000 inches. On another stream which carries in the irrigation season less than 200 cubic feet of water per second there were claims amounting in the aggregate to 147,600 cubic feet per second. On another river whose greatest measured flow is less than 60,000 cubic feet per second there are claims amounting in the aggregate to 461,794 cubic feet per second in addition to six separate claims of the entire supply.

The situation in California is the situation in nearly every other arid State or Territory. Before the value of water was appreciated titles to its use or control in amounts far beyond the present or any possible future need of appropriators were repeatedly established, and the question whether these excess rights are now to be corrected or to be recognized as vested rights is one of the grave issues confronting irrigators, lawmakers, and courts in every Western State.

In 1884 and 1885, while acting as assistant State engineer of Colorado, I measured the ditches of northern Colorado on the streams which had been previously adjudicated. My report of these measurements called attention to the discrepancy between the decreed appropriations and the actual carrying capacity of these ditches and canals in the following terms:

"So great was this in some instances that the result of the gaugings and the decreed capacity seemed to have no connection with each other. Ditches were met with having decreed capacities of two, three, and even five times the volume they were capable of carrying, ever have carried, or will probably ever need. Other ditches in the same district have decrees which fairly represent their actual needs. It needs no argument to show the worse than uselessness of these decrees as a guide to the water commissioner in the performance of his duties."

When these decrees were rendered the majority of appropriators believed that rights for irrigation were limited to the lands already irrigated, and that, so long as used there, the actual volume stated in the decree cut very little figure. Hence there was little solicitude on the part of late appropriators as to any danger arising out of excessive grants. Under the terms of these decrees each appropriator is entitled to a definite volume of water, described in cubic feet per second, and to a continuous flow of this volume throughout the year.

Recent decisions have recognized the right of the holders of these decreed appropriations to sell the entire volume granted. As a result, the owners of earlier pri-

Relation between the mean monthly discharge of the Poudre River and the appropriations therefrom.

orties are enlarging their ditches and extending them to other lands, or, where this is not possible, are attempting to dispose of the surplus to other users. Every attempt to do this, however, is contested. The truth is that irrigators have, in practice, been building up a system of one theory of water rights while the courts have rendered a number of decisions based on another theory. We have now reached a point where one of the two must give way. If the doctrine laid down in these decisions is carried to its logical conclusion it will transfer the ownership of a majority of the

streams of northern Colorado to a few early appropriators, and compel a large proportion of the actual users of water to purchase from such appropriators the water they have heretofore had for nothing. That this is not an extreme statement is shown by the accompanying diagram, which exhibits the relation between the mean monthly discharge and the decreed appropriations of the Poudre River.

The last examination of the records showed there were 104 appropriators from this river, the aggregate of these rights being 4,632 second-feet, each right being for a continuous discharge of the volume decreed; yet in August of 1894 the stream carried only 162 cubic feet per second; in August, 1893, 141 second-feet, and the stream has frequently fallen during the irrigation season to below 100 second feet. If the holders of these rights had lived up to their opportunities during the last half of their irrigation season, fully one-half of the actual users of water would have had to buy from the holders of these excess rights every gallon of water used after the middle of August. That they have not been compelled to do this is due to the fact that irrigation practice in that State is superior to irrigation law.

The appreciation of the dangers which this situation creates is not confined to farmers alone. In a different brief from the one before referred to it is thus forcibly stated by Judge Elliott:

"Excess priority decrees are a crying evil in this State. From every quarter the demand for their correction is strong and loud. Such crying demand can not be silenced by declaring that the meaning and effect of such decrees can never be inquired into, construed, or corrected after 4 years.

"In many cases such decrees are so uncertain, so ambiguous, so inequitable, so unjust, and their continuance is such a hardship that litigated cases will be continually pressed upon the attention of the courts until such controversies are heard and settled, and settled right. Litigation in a free country can never end while wrongs are unrighted."

The settlement of this issue is not of local importance. It concerns the State and nation as much as the individual irrigator. The individual irrigator needs to know who owns the water he uses, if State or national aid is to be extended. It needs to be known who owns the water which public funds render available.

Before either public or private development proceeds much farther there is need of some more general agreement regarding the nature of a water right than now prevails, as well as some more effective means of disposing of streams than has yet been provided. For several years Canada has been dealing with this problem and has finally reached a definite result. The fact that their conditions are similar to ours makes the general principles which underlie the Canadian irrigation code worthy of our study. These principles are given below:

"(1) That the water in all streams, lakes, ponds, springs, or other sources is the property of the Crown.

"(2) That this water may be obtained by companies or individuals for certain described uses upon compliance with the provisions of the law.

"(3) That the uses for which water may be so acquired are 'domestic,' 'irrigation,' and 'other' purposes, domestic purposes being limited to household and sanitary purposes, the watering of stock, and operation of railways and factories by steam, but not the sale or barter of water for such purposes.

"(4) That the company or individual acquiring water for irrigation or other purposes shall be given a clear and indisputable title to such water.

"(5) That holders of water rights shall have the protection and assistance of permanent Government officials in the exercise of such rights.

"(6) That disputes or complaints regarding the diversion or use of water shall be referred to and settled by the officials of the Government department charged with the administration of the act, and that decisions so given shall be final and without appeal."

It is interesting to compare these principles of the Canadian law with those underlying the Wyoming irrigation code, Wyoming having gone farther than any of the other arid Commonwealths in direction of public control of streams. These follow:

"First. That water is not subject to private ownership, but is the property of the State.

"Second. That the board of control is the trustee for the administering of a great public trust in the interests of the people of the State.

"Third. That all rights to divert water from the streams must be based on beneficial use, and that the right terminates when the use ceases.

"Fourth. That the volume diverted shall in all cases be limited to the least amount actually necessary for the accomplishment of the purposes of the diversion.

"Fifth. That under no circumstances shall the water diverted for irrigation exceed 1 cubic foot per second for each 70 acres of land actually irrigated.

¹ Bul. 58, Office of Experiment Stations, U. S. Department of Agriculture, pp. 30-32.

² Bul. 95, Office of Experiment Stations, U. S. Department of Agriculture, p. 12.

"Sixth. That the right to the use of the public waters attaches only to the use for which the right was originally obtained.

"Seventh. That the right of diversion for irrigation attaches to the land reclaimed and none other; that the transfer of the land carries with it the right, and that apart from the land the right can not be transferred.

"Eighth. That when a ditch waters land not the property of the ditch owner the right attaches to the land on which the water is used and not to the ditch. The owner of the lands irrigated makes the proof of appropriation and the certificate is issued to him. No certificate of appropriation can be issued to a ditch owner for the watering of lands not his own. The ditch owner is a common carrier and is subject to regulation as such.

"Ninth. That when proper diligence has been exercised in the construction of works and in applying the water to the purpose for which it is diverted the priority is fixed by the date of beginning the survey. When diligence is lacking, the priority dates from the time of use."

Q. (By Mr. FARQUHAR.) Does the State control the reservoirs?—A. Except for 2 or 3 reservoirs in Colorado, all the reservoirs there are in the West are private property, and their owners exercise the same control over them that they do over ditches. Irrigation from reservoirs has not yet, however, assumed much importance as compared to irrigation from canals which take water directly from the streams. So long as there is water running in a river which can be diverted there is no need of reservoirs, since storage is only an added expense to the direct diversion from streams. On every river, therefore, reservoirs receive little attention until the natural flow has been utilized; that is, on rivers having a perennial flow. On the Poudre River in Colorado, however, the natural flow has been exhausted and an extensive system of private reservoirs have been built to supplement it.

Q. (By Mr. KENNEDY.) How far is Greeley from the head of the stream that feeds their canal?—A. About 125 miles from the head; about 40 miles below the head of the upper ditch.

Q. Are there lands adjacent to that river all the way to the head, as well as the Greeley Colony lands?—A. Only to where the stream leaves the mountains, about 40 miles above.

Q. Plenty of water for all?—A. No; there is plenty of water early in the season, but they have had to resort to storage to secure enough for the later part of the season.

Q. (By Mr. A. L. HARRIS.) Is there a possibility for storage so as to economize the water at dry seasons?—A. Yes.

Q. What is the effect, if any, of storage on prior rights?—A. That is a troublesome question to answer.

We will take up the question of storage in connection with this matter. Bulletin 92 deals with the subject of storage on the Poudre River. It is the stream where storage has been carried further, probably, than any other in the whole Rocky Mountain drainage area. The diagram of the run-off of that river in the different months of the irrigation period for a large number of years shows that distribution of water during the season is far from uniform. The highest water occurs in May, and from the middle of May to the middle of June nearly half of the entire year's discharge runs away. The needs of irrigators in this valley are not in accord with this variation in discharge. They are now growing crops which require more water in July, August, and September than the stream will supply, and this has made it necessary for them to build reservoirs to hold back the surplus flow of the early summer months until it is needed. They have done this by utilizing natural depressions which lie outside of the channel of the stream, which are filled by the higher canals and turned into the lower ones. The development of this reservoir system has given rise to a very interesting system of exchanges between the canals, described in this bulletin, and hence need not be referred to here. Where reservoirs are located outside of the channel of streams there is no question of public policy involved in their construction and operation as private works, and as irrigation extends there will be more and more private capital invested in such reservoirs, because these investments are proving exceedingly profitable. But where reservoirs are located in the channel of running streams, and especially in the mountains on the headwaters of these streams, there is a question of public policy as to whether or not they should be built as public works, even if private capital is willing to undertake their construction. The water from reservoirs so located has to be turned into the natural channel of the stream and carried down with the natural flow to the valleys where it is to be used. If there is no public control of streams, irrigators will not discriminate between the natural flow and the stored supply. They will raise their head gates and take whatever comes in. Unless there is some means for the public regulation of head gates, those having no right to the stored supply will often times have a better opportunity for

¹ Bul. 96, Office of Experiment Stations, U. S. Department of Agriculture, pp. 49 and 50.

securing it than its legitimate owners. If public regulation is attempted, certain perplexing questions are sure to arise. If there are no restrictions on the price that the owner of the reservoir charges for his water, those injured by public control will be certain to urge that the taxpayer's money is being expended for the benefit of an oppressive monopoly. If the law which protects the reservoir owner also regulates the charge which he may make for water, there will still be controversies as to whether the rate is reasonable. If, however, these reservoirs at the heads of streams are built and operated as public works, and the water they impound used to make more secure the supply of the appropriators of the natural flow, just as bridges are built to facilitate the safe and comfortable travel of people of different communities, all these troublesome questions will be avoided. There can be no question, however, that the construction of reservoirs on the heads of streams makes necessary one of two things, either public ownership of the supply or public protection in the delivery of water stored in private reservoirs. Last year I had an interesting experience in observing the emptying of a reservoir built as a private enterprise on one of the tributaries of the Weaver River in Utah. The owners of this reservoir irrigate their lands from a ditch which diverts the stream many miles below. Between the outlet of their reservoir and the head gate of their canal were 11 other ditches all willing to share in the stored supply. There is no public control of streams in Utah, and the manager of the reservoir was greatly disturbed to know how he was to get the stored water past the head gates on the 11 ditches and down to the head of his own canal. In reply to his inquiry of me as to how I would accomplish it, I asked him how he had gone about it the year before. At first he was reluctant to tell, but finally said that he turned down enough water to wash out all the intervening dams, thus leaving a clear passageway. Before the dams could be repaired the reservoir had been emptied. He realized that this year the same expedient could not be employed. Fortunately, a temporary compromise was effected, which answered for the season, but the same issue must be met next year, and there will be no enduring peace or stability until the whole matter is regulated by law.

There is no question but that the subject of reservoirs will in the next few years assume a much greater importance than it has in the past, because on many streams it is the only means by which the area now irrigated can be extended. We can not determine too soon, therefore, whether we are to continue to permit their construction as private works or to build those on the head of streams as public works. I believe reservoirs located away from the channel of streams can be safely left to private enterprise. I believe those built to supplement the natural flow of streams and to meet the needs of a number of ditches or canals should be public works. Whether they should be State or national work depends on whether or not the present policy of having all rights to water regulated by State laws is to be continued. If it is, these reservoirs should be State work and owned and operated as a part of the State system.

Q. Should that matter be determined at an early date?—A. It ought to be, in order that both State and national laws shall be in accord with the policy adopted. Any uncertainty regarding future legislation is also likely to interfere with the building of ditches and the reclamation of new land by individuals or corporations. The success of irrigation depends so largely on the wisdom or weakness of the water laws in force, that if any changes are to be made the sooner they are made the better.

Q. Is there any reason why the State could not take hold of the whole subject of irrigation within the State and thereby protect the private landowners?—A. There is not. On the contrary, the fact that the subject is of paramount importance in each one of the arid States, that the people who have made the beginning understand local conditions and necessities, makes it possible for the States to bring to the solution of the problems of irrigation a higher intelligence and more direct interest than can be secured in any other way. That they have not succeeded in the past has been due in part to a lack of appreciation of the necessity for legislation and to a disagreement regarding the principles which should govern the ownership of water. The States are entirely capable, in my judgment, of regulating and protecting all interests connected with this subject; but they are not capable, under present conditions, of securing the full utilization of their resources. As I have before stated, on some of the larger rivers it will cost more to irrigate land than private capital can afford to expend. The building of reservoirs as public works to provide for the larger utilization of rivers does not appeal to private investors. In both cases, however, there is an argument in favor of the expenditure of public funds which does not appeal to the private investor. The public reaps benefits from the construction of irrigation works which private capital can not share. It gives to land now worthless a high value, and largely increases the taxable resources of the States and the productive wealth of the whole country. If the arid States were in a position to build canals and reservoirs, there are many instances where it would be wise public policy for them to do so; but, unfortunately, they lack the resources to undertake this. They are young and sparsely populated, the expenses

of maintaining local government are heavy, and all of this has to be paid for by taxes levied on only a small fraction of the land within the borders of each of these States. The table which follows shows how large a percentage of the area of each of these States is still public land. It contributes nothing in the way of taxes to the local government and can not be used as a basis of credit to borrow money for its improvement.

Table showing total area of each of the arid and semiarid States, the area of public land still remaining undisposed of, and the area set apart for Indian reservations.

State or Territory.	Total area.	Undisposed of and unreserved.	Indian reservations (estimated).
	<i>Acres.</i>	<i>Acres.</i>	<i>Acres.</i>
Arizona.....	72,876,800	50,286,986	15,150,757

Total.....	959,213,440	528,958,630	48,912,358

It has been suggested, and a number of bills have been introduced in Congress embodying the idea, that the States be given the proceeds of the sales of public lands within their borders as a fund with which to construct important public irrigation work. The following table shows how much the States would have realized from this during the year 1900:

Table showing receipts from the sale of public land in the arid States and Territories for 1900, less cost of local land offices.

State or Territory.	Amount.	State or Territory.	Amount.
Arizona.....	\$32,000	North Dakota.....	\$314,000
California.....	120,000	Oregon.....	284,000
Colorado.....	172,000	South Dakota.....	150,000
Idaho.....	126,000	Utah.....	67,000
Montana.....	377,000	Washington.....	182,000
Nebraska.....	72,000	Wyoming.....	166,000
Nevada.....	7,000		
New Mexico.....	38,000	Total.....	2,107,000

These revenues represent sales of land. They can be largely increased if some system is devised for collecting a revenue, by rentals or otherwise, from the public grazing lands. It must be borne in mind that only a small fraction, probably not more than 10 per cent, of all the lands of the arid region can be irrigated, while of the arid land still remaining public the irrigable percentage is much smaller, certainly not over 5 per cent and probably not over 2 per cent. The reason for this is that lands easily irrigated have passed into private hands. The public lands along many rivers require more water than the streams contain. Of the remainder of the public lands more than 400,000,000 acres are grazing lands, valuable for pasturage purposes alone. Sooner or later it will be necessary for the Government to exercise some sort of management or control over these lands in order to prevent neighborhood controversies and preserve the native grasses from being destroyed from overstocking the range. If in connection with this a leasing system could be devised which would unite the grazing and irrigable lands in such a way that each irrigator could have a right to lease a small area of the contiguous pasture land a large income from rentals would be secured and both the irrigable and grazing interests put on a more secure footing than now. In order to show the possibilities of these rentals the fol-

1064 HEARINGS BEFORE THE INDUSTRIAL COMMISSION.

lowing table has been prepared to show the income some of the arid States receive from the small areas they lease:

Summary showing results of leasing State and Territorial lands in some of the arid States and Territories.

State or Territory.	Total area of State or Territorial lands undisposed of.	Acres under lease at close of last fiscal year or biennium.	Total rents received.	Average rental per acre.
Colorado	3,689,938	1,251,770	\$108,121	\$0.082
Idaho		32,271.98	23,060	.614
Montana		985,912	112,467	.112
Nebraska	2,483,372	1,878,143	(2)	
Utah		106,631	6,300	.059
Wyoming		1,969,945	80,841	.011

a Total receipts for biennium ending Nov. 30, 1900, for interest, rentals, bonus, etc., were \$782,975.65.

A few of the States have received aid in the way of land grants. Colorado was given 500,000 acres of land to provide a fund for making public improvements. Some of this money has been spent on irrigation works.

Q. What is the name of that grant?—A. Public improvement fund. Reservoirs and ditches are not the only public improvements for which this fund could be expended. Roads and bridges belong to the list, and the greater part of the fund has been expended in their construction. Utah was given 500,000 acres of land to provide a reservoir fund, but that was a recent donation, and I do not think that any of the lands have been sold. There are other means, however, for promoting the growth of irrigation besides the appropriation of money. The present land laws were framed for the humid region. They do not meet the requirements of the arid region. The benefits which can come from their modification have been illustrated in the passage of what is popularly known as the Carey Act, which gave to each State the power to control 1,000,000 acres of land during its reclamation. It has resulted in the irrigation in Wyoming of about 100,000 acres of land, which would never have been reclaimed under the public-land act. The projects inaugurated under this act in Idaho embrace in the aggregate about 400,000 acres. In both of these States the conditions of irrigators are rendered superior to the average result where land is reclaimed under the homestead or desert-land acts. To acquire land under this act in either of these States there must be actual settlement and cultivation. No one can acquire more than 160 acres, but attached to that 160 acres is a water right and a share in the canal which supplies the water under it.

Q. Let me ask this question: If a stream is interstate is there danger of conflict of authority between the States as to the rights of water?—A. Yes; such conflicts have already arisen and they are likely to arise in the future, although the importance of this question is not nearly so great as securing a proper division of water between users inside of a State. The lack of any law to determine how the waters of an interstate stream shall be divided is only one instance of a number of the uncertainties which now exist regarding the limits of State and Federal jurisdiction over the control of rivers. There is in addition the conflicting rights of irrigation and navigation, which in California apply to rivers wholly within the State's borders. Here the Government looks after the rights of navigation and the State after the interests of the irrigator. The relative rights of navigation and irrigation have been raised in litigation over the waters of the Rio Grande, and the decision of the United States Supreme Court indicated so strong a tendency toward maintaining the interests of navigation as to give rise to considerable apprehension in many parts of the West. The conditions along the Missouri serve to show why this is true. This river drains a large part of the country east of the Rocky Mountains, and, with its tributaries, is the main dependence of Montana, the Dakotas, Wyoming, Colorado, Nebraska, and Kansas for the water used in irrigation. If it should become necessary to close the head gates to prevent steamboats from running aground it would put an end to all hope of any considerable increase in the acreage now cultivated. I believe, however, that this is a theoretical rather than a practical question, since, owing to the fact that the tendency of irrigation is to equalize the discharge of streams, reducing the floods and raising the low-water discharge, its extension on the headwaters of the Missouri will be a help to steamboats instead of an injury. It has been found that ditches along the lower end of a stream which formerly were unable to secure any water in July now have an ample supply the season through, because of the increased flow from seepage and percolating waters.

Q. I believe you have not said anything yet in regard to the cost of irrigation and its value, have you? I do not want to anticipate.—A. No. The first ditches built always are the cheapest. Men go along streams and find a place where they can take out little ditches in the favorable bends, and such ditches cost but little more than later laterals from main canals.

Q. (By Mr. LITCHMAN.) Have you gone over the manner of making the ditch?—A. Yes. So that from a great many of the earlier ditches water was taken out and spread over the lands for anywhere from \$2 to \$5 an acre. A great deal of land was irrigated and ditches were built for prices not to exceed that. When you come to building large ditches you have the expense for the lateral and also the expense for the main canal, and there the expense runs all the way from \$5 to \$15 an acre. We have about reached the point where the cost is above that, because we are now dealing with the large rivers that require costly head gates and where the fall is less than where the first small ditches were built. While the streams that were first used had a fall to the mile ranging from 5 to 50 feet, we now have to deal with such streams as the Missouri, which has a fall of from 2 to 10 feet to the mile, and the Big Horn, with a fall during a large part of its course of about 4 feet to the mile. There you have to build a much larger canal to get onto the table-land bordering the river, or you have to build a costly dam in the river to raise the water up at the outlet, and the larger projects which remain to be built will require a much larger outlay. The estimates on a good many of these canals range anywhere from \$7 to \$20 an acre for water, and that is a higher price than can be paid, because there has to be added to the cost of the water the cost of the settler's equipment, including the expense of his house, his tools, his stock, and of putting his land into condition for cultivation. The surface of the land has to be smoothed off so that the water can be made to flow over it, and in many cases where there is sagebrush on the land it has to be removed; so that the expense of putting the land in condition for distribution of water is frequently almost as much as the land is worth. And in many places where there is an abundance of land it is not being developed, because it would cost as much to develop it as it would to buy an improved farm in the older States in the Mississippi Valley. There is no inducement for immigration under such conditions.

Now, the value of irrigated land is governed by nearness to local markets, by the climate, which governs the kinds of products grown, and by the distance and cost of railway transportation to the great markets of the world. In southern California and around Phoenix, Ariz., where you can raise citrons fruits and other high-priced products, irrigated land reaches a value as great as is found anywhere in this country, or perhaps in the world. There lands having no improvements except the orange orchards planted on them have sold as high as \$1,800 an acre, perhaps higher. I have seen lands that sold for that price in southern California, and water has a corresponding value. Water rentals reach to figures that would be impossible elsewhere in the irrigated sections. I know of instances where water rents for \$45 an inch a year, and where rights to it reach as high as \$1,000 an inch. Now, when you come to the northern part of the arid region, the portion that competes with the agricultural districts east of the Rocky Mountains, there you get into districts having cheaper water supplies and cheaper lands.

Throughout its greater part the arid region will always be largely devoted to the raising of live stock and to gardens to supply the mines and the manufacturing and commercial centers of the region. After you have satisfied your local market the only demand for your produce is for furnishing the winter's food supply for live stock, and aside from these two outlets there is no basis for any large development. The live-stock industry is largely based on the use as a grazing ground of the remaining public lands and the private lands that have passed out of the hands of the Government or the railroads. Formerly it was the practice to turn cattle and sheep loose on these grazing lands and let them go from youth to old age without ever having any care or shelter during either winter or summer. They earn their subsistence off the open range. But that is now giving way to the practice of feeding in winter. This is not voluntary; it has been forced. The overpasturing of the public and private grazing lands has made it impossible to depend on them for the winter's food supply, and you have to provide for it from other sources. Therefore you have to depend on the irrigated lands. Those lands, to be available, have to be distributed throughout the range country, because when the storms come in the winter you can not supply stock 50 or 100 miles from a railroad, even if you had an unlimited supply of feed at the railroad. It is impossible to transport it. You must store it where it is needed, and the needs of the live-stock business have been one of the great incentives to irrigation, and furnish one of the best markets for grown crops, principally native hay and alfalfa. Those are the two leading general products of the grazing region.

Q. (By Mr. A. L. HARRIS.) Would it be possible to raise wheat and corn at a profit with the high price for water rights?—A. I do not think corn can ever become a general crop under irrigation. It is grown in restricted areas as a part of the system of rotation, but there is a considerable portion of the arid land where the

nights are too cold for it. In fact, it is a characteristic of the arid region that the nights are too cold to make it a corn-growing region. Besides, alfalfa is a better stock food, and you could not grow corn at a profit if you had to ship it out. The same thing is true of wheat. Unless there shall be a market which can be reached by water, and without excessive railroad charges, there will never be any large development of the wheat-growing industry in the irrigated regions. You can not grow it and ship it out. The great bulk of the wheat grown now is consumed at home, and in a good many of the arid States enough is not raised to supply the home demand—not nearly enough. Montana, Wyoming, and Idaho are all importers of flour. They are also considerable importers of oats. They have not reached the point where they supply the home demand, and it is true of nearly all those States that the development of mining the precious and useful metals and the resulting growth of the home demand for the local food supply is now going on faster than the extension of irrigation. Furthermore, when we have done all we can there will not be 10 per cent of the territory west of the one hundredth meridian and east of the rainy districts on the Pacific coast that can ever be brought under cultivation. Either there is not the water or it is not available. We can never make use of but a small fraction of the Columbia, it is certain we can never utilize all of the Colorado, and it is doubtful if we can ever completely use the Missouri.

Q. (By Mr. LITCHMAN.) Have you gone into the question of artesian wells?—A. Yes; I know something about artesian wells.

Q. Would it be true if the land were irrigated, as you propose, that a given quantity of stock could be raised on a less area of land?—A. Oh, yes; I think so.

Q. And would not the limited amount of land as suggested by you be compensated by that fact?—A. Oh, yes; only you would have a great many more people. As it is now a great many men interested in the stock business will occupy 50,000 or 100,000 acres of land with flocks and herds. This plan I have suggested would make smaller flocks and herds and larger farms.

Q. (By Mr. A. L. HARRIS.) Would the lease system be better than the absolute title?—A. The only objection to the disposal of the public land by absolute title would be that there may be some of the land so disposed of for grazing purposes which is irrigable. I should say that the better plan for the present as a tentative measure would be the lease system; perhaps not ultimately but simply as an alternative or a temporary measure.

Q. How long would you have the lease?—A. Not for more than 5 years, and I would have every tract of land leased remain subject to entry under the public land laws and have the man who leased it take it with that condition. I would not restrict the operation of acquiring title under the present land laws at all, but would leave those open even on leased lands. It is my judgment that men would lease land and take those conditions; that is, men who leased land would know whether or not a homestead or a desert land filing can be made on it, and if they select land that is irrigable and subject to cultivation they take their chances.

Q. (By Mr. FARQUHAR.) These remarks that you make are predicated on the fact that you do not interfere with land already disposed of under the public land laws?—A. Entirely.

Q. You can not dispose of them or subdivide them?—A. No. You see there are between 300,000,000 and 400,000,000 acres of public grazing lands. My plan relates entirely to that land.

Q. (By Mr. A. L. HARRIS.) The earlier, then, some steps are taken in the direction of a general plan the better?—A. I think so.

Q. There has been a survey of a portion of this arid country by the Federal Government, has there not?—A. Nearly all the country is now subdivided by the general surveys. I think that a leasing system could be inaugurated, so far as that is concerned, without any additional survey. If you leave the lands subject to entry just as they are now there is no need of discriminating as to whether the lands are agricultural or pasture; they are open to entry just the same after they are leased as before they are leased. If you are going to make the lease absolute, so that when a man leased land for 5 years you could not file on it, then you would want to have an economic survey, and know absolutely what were irrigable and what were pasture lands; but if you do not make it absolute, and you make it simply conditional and leave it to the man who leases, then if he does not want to be interfered with, to go outside of the irrigable territory himself, then it would not make any difference.

Q. What has been the objection heretofore to the Federal Government adopting some plan of irrigation?—A. I do not think there has been any objection, except that in the East there has been a feeling that any large development of agricultural lands there would interfere with the prosperity of farmers in the East; that has been one objection outside of the irrigated territory. And there has been a question as to whether or not this was a matter which the General Government could take in hand without transcending the limits of the Constitution. That relates more, however, to appropriations of money for work. There can be considerable legislation without an appropriation of money that will very materially promote successful

development and which can properly precede appropriations of money or the determination of how money is to be appropriated. In the West there has been, and will be until this matter is settled, considerable discussion about the best means of extending Government aid, growing out of the sensitiveness of people who have rights to any disturbance of those rights. Communities have built up their systems under local laws and customs and have become wedded to them and they do not want them interfered with. On the other hand, there is in the West another element in favor of turning this whole matter over to the National Government and having the National Government have a complete system of laws and administration; but to do that will necessitate a revolution of existing systems.

Q. (By Mr. FARQUHAR.) It seems to be a question, does it not, of artificial development through irrigation under the expenditure of the National Government and the natural development of the settlement of the country through the present land laws of the country?—A. No, not that.

Q. Well, how is it?—A. It is a question between stimulated development under national aid or natural development, not under present land laws, but under laws framed to meet the conditions of the Western region.

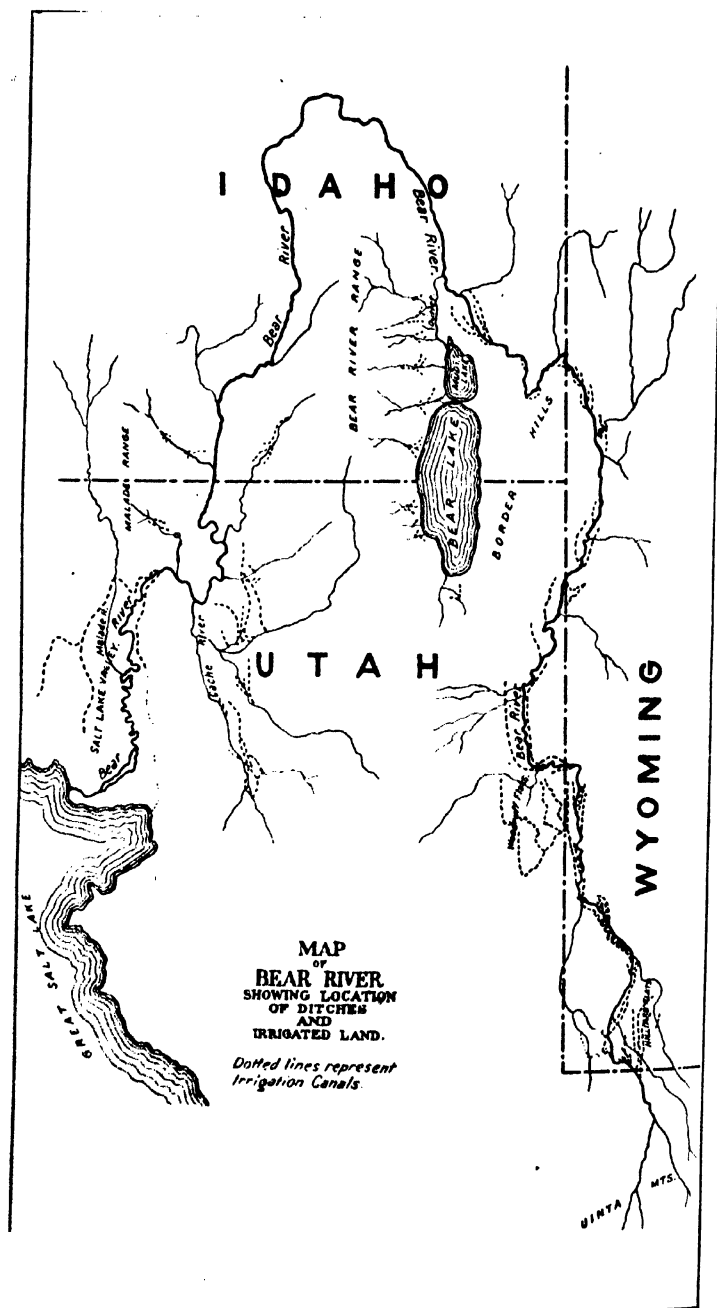

Q. Whether under State control or national control as far as the land is concerned?—A. Yes.

Now there is going to come a time, and that time is here now, when there will have to be an expenditure of public funds in order to secure certain kinds of development. There are rivers, like the Missouri, from which I do not believe it will ever pay within our lifetime to take the water, because it will cost so much that the land will not pay for it. Irrigated land and the value of irrigation improvements is measured by the value of lands in the Mississippi Valley or the value of irrigated lands under cheaper works, and you can go only just so far with private enterprise. Now, there are projects that would pay as a public work, perhaps, because in bringing land that is now worthless into a condition of productivity you create homes; you create taxable values that the public gets the benefit from, but that the private investor does not share in, and there is the argument in favor of State or national aid to certain classes of important works.

(Recess taken until the following day.)

Q. (By Mr. A. L. HARRIS.) Last evening when we took a recess you were about to take up the consideration of the Bear River country.—A. If the members of the commission will take Bulletin No. 70 and the map at the front [see next page], it will serve to illustrate the nature of some of the interstate complications. Bear River rises in Utah; the stream flows across the northern boundary of Utah into Wyoming. There is a section of it about 50 miles long in Wyoming, and then it crosses back on the western border of that State into Utah again. There is a section of 25 or 30 miles in Utah, and it crosses back into Wyoming, and then it leaves Wyoming and enters Idaho, and finally returns to the State of its source, Utah. This winding cuts that stream into five different sections, and there are ditches taken out of the stream along its entire course, and yet each one of those sections is absolutely independent of the other. Take the two sections in the State of Wyoming. The people have complied with all the requirements of the State law. They have recorded their rights; they have permits to appropriate water, and the doctrine of priority is the theory of the State; but it is impossible to enforce that doctrine of priority, because some of the last ditches to be built have their head gates just over the border in Utah and the Wyoming authorities can not go over there to close down the head gates. Consequently those people, although they have the last ditches, have practically the first right to the stream. In the same way there is no use to attempt to enforce priorities on the upper section of the stream in Wyoming in favor of earlier rights on the lower section in Wyoming, because if the water were not taken out above it would simply go into Utah and there appropriators would take it without any reference to Wyoming rights. Exactly the same thing is true in reference to the improvement of Bear Lake. There is an important storage basin that the irrigators on the lower end of the river desired to develop; but they were confronted by the fact that if they did store the water and turn it out into the stream all the ditches in Idaho would have the first chance to utilize that water supply and they would have no means, unless it was recourse to the courts, to prevent it. Now, if we had been aware of the development that was coming, we could have avoided all those complications by changing the boundary about 10 miles. So far as Wyoming and Utah were concerned, it would have thrown the whole of that stream into Utah. There are a great many instances of this kind where a very slight change of State boundaries, having them follow divides, would have entirely obviated interstate questions; but as it is now it is one of those open, unsolved problems that will in time either be settled in the courts or by State or national legislation.

Q. You desired to make some reference to the California map. Have you that at hand?—A. That was simply to illustrate. We have the map here, but I think we have gone over the points. I may, perhaps, in speaking of the extent of irrigation

and the restricted areas that are irrigated and will be irrigated, call attention to one of the California maps here that shows the relative area irrigated in the leading irrigation State of the country with the unirrigated and uncultivated portions. The purple areas there are the areas that are irrigated.

Q. (By Mr. LITCHMAN.) Appears to be a very small portion?—A. Very. That is true of every State if you compare the total.

Q. (By Mr. A. L. HARRIS.) Now, you will please take up the humid parts of the United States.—A. We have in this country been considering irrigation as a sectional matter, and it never will have the importance in the East that it has in the West. But there is every reason to believe that irrigation is to be largely employed throughout the humid portion of the United States in the growing of high-priced and special products. The work done in Connecticut, Massachusetts, and New Jersey shows that in the growing of small fruits irrigation is exceedingly profitable, and in market gardening it is now being largely utilized. The cranberry growers of Wisconsin and the farmers in the sandy pine lands of the Northwest are beginning to utilize irrigation as a means of getting crops started, of getting a sod established on those sandy lands; and there seems reason to believe that there will be quite extensive stretches of territory scattered through the humid districts where irrigation will be very largely employed. The market gardeners around our large cities in the East and the tobacco growers of Connecticut are using irrigation to some extent in the growing of fancy varieties; and in the South irrigation seems certain to have a very large usefulness. In the past 5 years more land has been brought under irrigation in southern Louisiana and southern Texas than in any single State of the the arid region within that period, and there has been more money invested. Not only that, but in its engineering features irrigation in these States is entirely distinct from that of the irrigation of the arid regions. Now, in the arid regions water is conducted by gravity. You have a rapid fall away from the mountains which carries the water through the canals and away from the streams. But in the South the streams have little or no fall. They are simply reservoirs with the water in them practically stationary. You have to pump water up into canals, and then it flows very slowly, because the country has so little fall. So canals are built there that are simply banked reservoirs. Instead of a channel cut below the surface of the ground, 2 banks are built, sometimes 200 feet apart. Now, the canal is the land between those two banks. The banks could just as well be 400 feet apart.

The width of the canal has nothing whatever to do with the cost. These long lines of embankment will be built and the water pumped up from the river into the canal. Now, turning water out at different points causes the current; it is the inclination of the water surface rather than the inclination of the land. Now, in order to reach a higher territory, they establish at convenient points other pumping stations, and raise the water up to a higher level. This method of irrigation has been extended until now the country embraced is about 200 miles in length and about 50 miles wide. It is not all irrigated now, but that is the total area in which irrigation is being extended.

The first canals were taken out of the sluggish streams that flow into the Gulf of Mexico; but when the importance or the value of the rice product became established, and lands rose in value from \$5 to \$50 and \$100 an acre, it became manifest that those streams would not supply the need of water, and the farmers began looking about for other sources of supply. They found one by putting down wells, so that the pumping stations to supply water from the rivers are being supplemented largely now by wells. Hundreds of wells are going down throughout the portion of Louisiana where rice is grown, and this year a study is being made to determine the source of that water supply. If the subsoil is simply filled with water, and it can be pumped out, it will soon be exhausted; but there is a belief that it is being replenished from the Mississippi. That was a conjecture at the time I was there, but a study is being made to ascertain if it is true. If it be true, there will be a capacity for indefinite extension of the supply by wells.

The success of rice-growing there, after the long period in which we had been continually shrinking in our rice production, has led to increased interest in rice growing along the Atlantic seaboard. For years the rice growing there, if not unprofitable, has not been sufficiently profitable to lead to any extension. In fact, there has been a constant decline. Old canals in use long before the war were going out of operation; but the industry is now being extended, and the question now is whether the Louisiana method can be adopted.

Rice cultivation in the Carolinas is largely after the methods prevailing before the war. The crop is harvested by hand—cut with the sickle and bound by hand. The reason it is so much more successful in Louisiana is the application of modern machinery. The crops there are cut with a self-binder. There have been economies brought into the field labor, and the methods of applying and distributing water are patterned after those of the West rather than those of the Carolinas. There is an economy in the distribution of water, and there is another very marked economy in

the harvesting of the crop. An industry that was not before remunerative has been made exceedingly profitable.

The southern territory is also likely to develop irrigation in the growing of forage crops. Alfalfa grows in the South. It will not grow in the middle East; it freezes out in the winter and does not seem to thrive, but it will grow and live through the winter and become a perennial in Louisiana. There seems to be quite a field for the use of irrigation in the growth of alfalfa and other forage crops in the South wherever you can get water at a sufficiently low cost.

Now, the same questions arise in the East, where development has gone far enough, that have arisen in the West. In the South the question has come up between the different canals as to who has the better right to the water supply if more water is needed than the wells will supply. In time some system of priorities will have to be established there. They will have to determine how they are going to operate under the doctrine of riparian rights. That is an unsettled question there as yet, just as it is in the West. On one of the streams last year so much water was pumped out that the river changed its direction and ran up stream for a distance of 50 miles. The current changed and ran back and salt water came in from the Gulf and ruined the usefulness of the pumps in the stations furthest downstream. Those are matters that will require adjustment. If there should be in the East any considerable demand on the streams, the right to take water from Eastern streams will be called in question; so that the economic and legal phases of irrigation have already ceased to be sectional.

Now, there is a very large district reaching from the Gulf of Mexico to the Canadian border, embracing western Texas, western Kansas, western Nebraska, and the western Dakotas, which were first settled up in their humid parts. They were settled up quite sufficiently in the western arid or semiarid parts to render irrigation problems important. They are in some respects among the best parts of the arid region, because ditches there can be built at small cost. It is a country well adapted to the distribution of water, and only a comparatively small amount of water is required to supplement the rainfall. As you go farther West, if you have only 10 inches of rainfall and of increased evaporation, you must supply more moisture by irrigation than where you have 20 inches of rainfall and less evaporation; so a given amount of water will irrigate more acres there than farther West.

In this central region we have two questions. In the Dakotas it is very expensive to bring water from the Missouri River, and in Nebraska we have the uncertainty at the present time regarding the State law. Nebraska is comparatively well supplied with water. The North Platte is a stream that can not be utilized to any great extent in the west. The Loupe is a good stream; and they have in these two rivers an opportunity for a very large development. As you go south of that the difficulty in Kansas is the question as to the extent of the underflow and whether it is practicable to get some means of pumping it up.

When you go south into Texas you have still a different question. In southern Texas there is a considerable territory that can be irrigated from springs and wells, and also all the way through Arizona and New Mexico.

A great many streams are torrential in character, carrying an immense flow of water and then running down to nothing. You must store these streams in order to make much use of their waters, and the problem of storage is a complicated one. It involves the question of the sediment in these Southern streams—the silt. It is disastrous to build a reservoir in the channel of a river, and, when you have a large investment in houses and people settled there, to have it fill up and necessitate these settlers moving out. It is simply a waste of energy and a waste of money. That is a question that the Department of Agriculture is studying, and arrangements have been made with the agricultural college of Texas to gather samples from these streams and see what would be the probable result of letting the mud they carry deposit on the soil.

Q. Does evaporation go on so rapidly in some portions of the country that it would leave the reservoir salty?—A. The total evaporation from the water surface in the West ranges from 3 to 6 inches per month. Where the waters of the river itself are heavily charged with alkaline salts this evaporation will so concentrate them as to make it injurious; but there are very few instances of that kind. The only one that I know of personally is the Pecos River, and I think that action only occurred in one season. I do not think that would be a very important question. The streams carry so little alkali in the portion of the country where the water is stored that the accumulation would not amount to much. Then the water is discharged every year and there is no cumulative action. It is only the concentration that would take place in a single season.

(Testimony closed.)

EXHIBIT A.

Water right.

FRESNO CANAL AND IRRIGATION COMPANY.

[Incorporated February 16, 1871.]

FRESNO, FRESNO COUNTY, CAL.

This agreement, made the — day of —, 19—, between the Fresno Canal and Irrigation Company, the party of the first part, and —, the part— of the second part, witnesseth:

That for and in consideration of the sum of — dollars, gold coin of the United States, paid to the party of the first part by the part— of the second part, the receipt whereof is hereby acknowledged, and of the covenants and agreements herein contained, the party of the first part agrees to furnish to the part— of the second part, from the main canal of the party of the first part, or from a branch thereof, all the water that may be required, not exceeding at any time — cubic — per second, for the purpose of irrigating the —, in Township No. — south, range No. — east of Mount Diablo meridian, from the — day of —, 19—, until the 16th day of February, 1921, and during the existence of said corporation.

The party of the first part agrees to place a suitable box or gate in the bank of said main canal, or a branch thereof, at the most convenient point for the conveyance of the water to said land, as soon as the ditch to be constructed by the part— of the second part shall be commenced.

The part— of the second part will construct a ditch from said box or gate to said land at — own risk, cost, and expense; and it is covenanted and agreed that the ditch so constructed may be a branch ditch of said company, and he under the control thereof, at its option, and that said company shall have the right to use and enlarge said ditch, provided such use will not interfere with the flow of water to said land; and the part— of the second part hereby grant — to the party of the first part the right of way to convey water through any of — lands situated in said township to contiguous land.

The part— of the second part covenant— and agree— that — will not use or permit the water to be used on any other land except the land above described, or permit the water to run off on any contiguous land, or permit the water to spread out in low places on such land, or in any way to run to waste, and — will construct ditches to convey the surplus water, if any there be, back into the canal of said company, or a branch thereof.

It is understood and agreed that the water to be furnished under this agreement is intended to form a part of the appurtenances to said land, and the right thereto shall be transferable only with and run with said land, and that the party of the first part is bound by this instrument to all subsequent owners of said land, but to no other person.

The part— of the second part, for —, — heirs, and assigns, covenant— and agree— that — and — successors in interest and estate in said land will pay annually to the party of the first part, at its office, in gold coin of the United States, on the first Monday in September, in each year, until the year 1920, and during the existence of said corporation, the sum of — dollars (\$—), and this instrument shall be deemed equivalent to a notice and demand on the day the same becomes due, by the terms hereof, and in case of default of such payment in any one year for the space of 30 days after it shall become due, this agreement shall terminate, and become thenceforth null and void and of no effect, at the option of the party of the first part, its successors, or assigns. And said part— of the second part covenant—, for —, — heirs, and assigns, that — will pay all legal expenses, including a reasonable attorney's fee, necessarily incurred by said party of the first part in the collection of said annual payment.

And it is further covenanted that the party of the first part may shut off the water any fall, for purposes of general or special repairs of its canals, bulkheads, or gates, and at such other times as urgent necessity may require; but shall restore the water in said canals as speedily as the nature of the case will permit.

It is covenanted and agreed by the parties hereto that the party of the first part shall not be responsible for deficiency of water caused by drought, insufficient water in the river, hostile diversion or obstruction, forcible entry, temporary damage by flood, or other accident; but that the party of the first part shall use and employ all due diligence, at all times, in restoring and protecting the flow of water in its canals and ditches.

It is understood and agreed that the party of the first part may sell 1,000 water rights of 1 cubic foot each, and if at any time the aggregate quantity of water in the

canals of said company shall fall short of 1,000 cubic feet flowing per second then each water right shall represent the one-thousandth part of said aggregate quantity, and the part— of the second part shall be entitled to receive water in that proportion.

It is covenanted that this agreement and the covenants therein contained on the part of the part— of the second part run with and bind the land.

It is covenanted that any violation of this agreement by the part— of the second part, or — assigns, shall render this agreement null and void, and of no effect, at the option of the party of the first part, its successors, or assigns.

In witness whereof the parties hereto have hereunto interchangeably set their hands and seals, the day and year first in this agreement written.

Executed in duplicate.

THE FRESNO CANAL AND IRRIGATION CO.,
By ———, *Secretary.*

EXHIBIT B.

Agreement for water right in the Larimer County ditch.

I. This agreement made this — day of —, in the year 188—, between the Larimer County Ditch Company, a corporation existing under the laws of Colorado, as the first party, and —, of the county of — and State of —, as the second party, witnesseth:

II. That in consideration of the stipulations herein contained, and the payments to be made as hereinafter specified, the first party hereby agrees to sell unto the second party — water right— to the use of water flowing through the ditch of said company, each water right representing one six-hundredth part of the capacity of said ditch (less an amount from such total capacity sufficient to water 80 acres), subject to the terms and conditions herein specified, to which the said second party, — heirs or assigns, hereby expressly agree.

III. Said company agrees to continue said ditch on a suitable grade to a point not less than 6 miles, on the line of said ditch, after crossing Box Elder Creek, having a width on the bottom of not less than 10 feet, and a depth of not less than 4 feet from bottom to top of lower bank, such extension to be completed on or before May 15, 1883.

IV. Said company agrees to incur all the expense of building said ditch and extension, of the dimensions hereinbefore specified, without any assessment on purchasers of water rights for such purpose.

V. Said company will enlarge said ditch and its extension when it shall deem expedient.

VI. Said company agrees to furnish said water to the second party, — heirs or assigns, continuously during the irrigating season, except as hereinafter provided, and at no other time.

VII. Said water shall be used only for domestic purposes, and to irrigate the following described tract of land, and none other, to wit:

VIII. Under no circumstances shall said water or any portion thereof be used for mining, milling, or mechanical power, or for any purpose not directly connected with or incidental to the purposes first herein mentioned.

IX. Said second party, — heirs or assigns, shall not permit said water, or any portion thereof, furnished as aforesaid, to run to waste, but as soon as a sufficient quantity shall have been used for the purpose herein allowed and contracted for, the second party, — heirs or assigns, shall shut off said water, and keep the same shut and turned off until the same shall be again needed for the purposes aforesaid; but in no case shall the amount of said water, taken or received by the second party, — heirs or assigns, exceed the quantity hereby sold.

X. Said company shall deliver said water at such point along the line of the said ditch, or from any of its reservoirs, either or all, as it may determine from time to time to be the most practicable, and all head gates, and the manner of withdrawing and regulating the supply of water from said company's ditch and reservoirs, shall be prescribed by said company, and shall at all times be under its control as determined and directed by the board of trustees of said company.

XI. The head gate or gates through which the water hereby sold shall be drawn off shall be made and placed by said company, and the cost thereof, and for keeping the same in repair, shall be paid for by the said second party, and be collected and enforced in the same manner as prescribed for collecting and enforcing assessments.

XII. Said company agrees to keep and maintain said ditch and any and all of its reservoirs in good order and condition, and in case of accident to the same to repair the injury occasioned by said accident as soon as practicable and expedient; and the company shall have a right to assess for said maintenance, and the cost of enlarging said ditch, and enlarging any and all reservoirs, either owned or operated by it, and repairing, maintaining, and superintending the same, a sum equal to one six-hundredth part per water right sold of such cost, per annum, and the amount, manner of collection, and time of payment of said assessments shall be determined by said company according to its judgment and discretion; and the company also reserves to itself the right to establish and enforce such rules and regulations, and to provide and declare such penalties and forfeitures as it may deem necessary or expedient for the purpose of enforcing and collecting said assessment, or any part thereof.

XIII. When said company shall have sold, and have outstanding and in force, 600 water rights, of a size and amount each as specified herein (or sooner, at the option of the company), it will then issue and deliver to the holder of each water right, who shall have complied with the terms and conditions of this contract, without further consideration, one share of the stock of said company and also one share of the stock of the Larimer County Reservoir Company for every water right hereby sold, which the second party, — heirs or assigns, hereby agree to accept.

XIV. Said company shall have the right to distribute such water as may flow through said ditch (less said amount sufficient to irrigate 80 acres) to the holders of such water rights, pro rata, and for the purpose of so doing may establish and enforce such rules and regulations as it may deem necessary or expedient.

XV. And the second party for ——— and ——— heirs and assigns agree, in consideration aforesaid, to waive, and hereby does waive any claim for loss or damage by reason of any leakage or overflow of said ditch, or any of its reservoirs, lakes, or laterals, either upon the land aforesaid or any other tract belonging to said second party or ——— assigns, anything in any statute, law, or custom to the contrary notwithstanding.

XVI. In consideration whereof the second party agrees to pay unto the first party the sum of ——— dollars, with interest, payable annually, at the rate of 12 per cent per annum, at the office of the first party in Fort Collins, Colo., in ——— payments, at the times and in the manner following, that is to say:

	Day.	Month.	Year.	Principal.	Interest.	Amount.	Remarks.
First payment.....							
Second payment.....							
Third payment.....							
Fourth payment.....							
Fifth payment.....							

And the second party, in consideration of the premises, hereby agrees that — will make punctual payment of the above sums as each of the same, respectively, becomes due, and that — will regularly and seasonably pay all assessments that may hereafter be imposed by said company for the purposes aforesaid.

XVII. And it is hereby agreed and covenanted by the parties hereto that time and punctuality are material and essential ingredients to this contract. And in case the second party shall fail to make the payments aforesaid, and each of them punctually, and upon the strict terms and times above limited, and likewise to observe, perform, and complete all and each of said agreements and stipulations aforesaid, strictly and literally, without any failure or default, then this contract, so far as it may bind said first party, shall become utterly null and void, and all rights and interests hereby created or then existing in favor of the second party, or derived from —, shall utterly cease and determine, and all equitable and legal interest in the water right hereby contracted to be conveyed shall revert to and revert in said first party, without any declaration of forfeiture, or any other act of said first party to be performed, and without any right of said second party of reclamation or compensation for moneys paid or services performed, as absolutely, fully, and perfectly as if this contract had never been made. And it is further stipulated that no assignment of the premises shall be valid unless the same shall be indorsed hereon, and that no agreements or conditions or relations between the second party and — assignee, or any other person acquiring title or interest from or through — shall preclude the

first party from the right to convey the premises to the second party, or — assigns, on the surrender of this agreement and the payment of the unpaid portion of the purchase money which may be due the first party.

XVIII. It is further expressly understood and agreed between the parties hereto that neither this contract nor any of its terms, conditions, or provisions shall be in any manner supplemented, altered, or changed from what has been provided, or any other or further contract be made respecting the subject-matter of this contract, except that it be indorsed hereon in writing, signed by the president and attested by the secretary, under the corporate seal of said company.

XIX. It is also stipulated and agreed that from and after the execution hereof the said second party may enter into the use and enjoyment of the water flowing through said ditch to the extent of the right above contracted to be conveyed, as fully as though a final certificate for said right had been issued, but subject, nevertheless, to all the terms and conditions above set forth.

XX. In witness whereof the Larimer County Ditch Company has caused its corporate name to be hereunto subscribed by its president, and its corporate seal to be hereunto affixed by its secretary, as well as to a duplicate hereof, and the second party — subscribed — name— and affixed — seal— hereto, as well as to a duplicate hereof, the day and year first above written.

LIST OF WITNESSES.

	Page.
Ager, Joseph B. , master of State Grange of Maryland	103-117
Bachelder, N. J. , master of State Grange, Patrons of Husbandry, of New Hampshire	40-45
Bailey, L. H. , of the College of Agriculture, Cornell University	1004-1015
Balch, L. C. , lawyer and planter, Little Rock, Ark.	495-498
Barrett, James , farmer, Augusta, Ga.	46-59
Brigham, Joseph H. , Assistant Secretary United States Department of Agriculture	4-28
Brown, J. Pope , president of Georgia State Agricultural Society	59-75
Budge, William , farmer and real estate dealer	843-858
Burke, W. H. , editor of Farmers' Voice	193-201
Clohan, Alexander , farmer, Martinsburg, W. Va.	591-604
Coles, Richman , farmer, Woodstown, N. J.	122-132
Cook, P. G. , secretary of Western Elevating Association	1017-1019
Crowell, John Franklin , writer on economics and sociology	332-347
Davenport, Prof. Eugene , dean of College of Agriculture, University of Illinois, and director of Agricultural Experiment Station, Champaign, Ill.	255-278
Deyo, Peter , secretary of New York State Board of Tax Commissioners	999-1000
Dillingham, Rev. Pitt , principal Calhoun Colored School, Calhoun, Ala.	163-169
Dodge, Hon. Martin , director public road inquiries, United States Department of Agriculture, Washington, D. C.	690-706
Duncan, B. O. , farmer, Newberry, S. C.	518-519
Dye, Franklin , secretary State Board of Agriculture, New Jersey	82-99
Edmondson, Peter , farmer, Memphis, Tenn.	501-505
Eldridge, John W. , Hillhouse, Miss.	512-515
Fernow, B. E. , director New York State College of Forestry	1000-1004
Flanders, George L. , assistant commissioner of agriculture of State of New York	995-999
Gage, William A. , cotton commission merchant, Memphis, Tenn.	491-495
Gehrmann, Adolph, M. D. , director of laboratory, department of health, Chicago	635-638
George, Milton , agriculturist, Chicago	220-227
Godwin, J. R. , planter, Memphis, Tenn.	474-480
Graham, William A. , farmer, Machpelah, N. C.	433-439
Greeley, M. F. , secretary of board of regents of education of State of South Dakota	927-945
Greeley, Samuel H. , commission merchant, Chicago	227-235
Hale, J. H. , farmer, Fort Valley, Ga., and South Glastonbury, Conn.	375-401
Hamilton, Hon. John , secretary of agriculture, State of Pennsylvania.	347-375
Hammond, Harry , cotton grower, Beach Island, S. C.	816-840
Hanley, John C. , general business agent for National Farmers' Alliance and Industrial Union and National Grain Growers' Association	273-295
Hill, John, jr. , commission merchant, Chicago	295-319
Hitchcock, Frank H. , chief of Section of Foreign Markets, United States Department of Agriculture	665-689
Holmes, George K. , assistant statistician, United States Department of Agriculture	152-163
Howard, L. O. , chief entomologist of United States Department of Agriculture	753-769
Hutchinson, T. F. , representative of American Cotton Company	509-512
Hutchison, D. P. , chairman board of trustees of Charlotte Township, Mecklenburg County, N. C.	1088-1048
Hyde, John , statistician of United States Department of Agriculture	840-842
Jones, Aaron , master of National Grange, Patrons of Husbandry	28-40

South Dakota	Juniper, 740
Southern States—	
Conditions of industry	Brown, 70, 71
Importers of	Wedderburn, 636
Little market for	Barrett, 56; Brown, 71
Yield per acre—	
Arkansas	Balch, 496
Georgia	Nunnally, 457
Illinois	Wilson, 251
Corn flour, mixing prevented by pure-flour law	Snow, 237; Kennicott, 532
Corn meal, adulteration of	Jones, 527
Cornell University:	
College of Forestry	Fernow, 1001
Nature study, leaflets issued by	Hamilton, 351
Short courses in agriculture, benefits of	Norris, 324
University extension in agriculture and nature study	True, 143
Corners, wheat, farm prices not affected by	Wilson, 253
Corporations:	
Fraudulent, collapse of, predicted	Powers, 191
Property of, assessed value	Dejo, 1000
Regulation advocated	Powers, 192; Hamilton, 374, 375
Taxation of, advocated	Ager, 112; Powers, 184, 185
Cost of living	Moran, 710; Turnbull, 977, 988
Cost of marketing crops:	
Cotton	Hanley, 289
Wheat	Hanley, 280, 287; Moran, 708
Cost of production:	
Corn, Illinois	Wilson, 251
Cost of labor, governed by	Saylor, 588
Cotton	Holmes, 160; Redding, 445; Norfleet, 489, 490; Hill, 503; Moran, 720
Relation to yield per acre	Peck, 457, 458
1889	Holmes, 154
Georgia	Hale, 397
Grain, meat, etc	Moran, 720

Cost of production—Continued.	Page.
Ignorance of farmers concerning, injurious effects	Dye, 96
Increase in Eastern States	Norris, 326, 327, 331
Machinery, tendency to diminish	Holmes, 156, 157;
	Davenport, 267; Clohan, 600; Miller, 617
Prices, relation to	Powers, 175, 176; Crowell, 330
Sugar beets	Kedzie, 547; Smith, 568, 575, 576; Saylor, 584
Too high for profit	Wedderburn, 624
Wheat	Moran, 707; Juniper, 732; From, 793
Cotton:	
Alabama	Poole, 920
American Cotton Company	Hutchinson, 509-512
Availability of crop for Southern States	Youmans, 117-119
Bagging and ties, expense of	Barrett, 50; Brown, 63
Baling—	
Defective	Hitchcock, 684
Methods of, expense, discussed	Barrett, 50, 51
Relatively unimportant question	Brown, 72
Caterpillars	Howard, 757
China, production and character of cotton	Barrett, 58
Classification, frauds in	Barrett, 49
Commission merchants, methods of handling	Brown, 68
Competition, foreign, lack of	Wedderburn, 632
Compressed	Hutchinson, 511
Compared with uncompressed	Porter, 482
Cost of production	Barrett, 49, 50; Lovejoy, 75;
	Holmes, 160; Redding, 445, 453; Balch, 496; Kyle, 466, 467, 473;
	Norfleet, 485, 489, 490; Hill, 503; Moran, 720; Hammond, 827, 832
Georgia and Texas compared	Barrett, 57
Relation to yield	Peek, 457, 458
Tennessee	Godwin, 477, 478; Manson, 507
Crop credit	Graham, 436
Crop liens, system and evils	Barrett, 47-49
Delta longer staple than hill cotton	Godwin, 478
Egyptian	Stubbs, 785
Excessive production due to credit system	Hammond, 827
Exclusive production	Brown, 60, 61, 71;
	Lovejoy, 76; True, 145, 146; Hammond, 827; Poole, 925
Exports to Asia	Hitchcock, 668
Factories	Graham, 439; Stubbs, 777
Alabama	Poole, 921
Mississippi	Kyle, 471
Negro laborers unavailable, reasons discussed	Hammond, 823
Southern States, conditions and advantages	Barrett, 52, 53;
	Brown, 67, 68; Porter, 480-482; Stevens, 918
Tennessee	Godwin, 479, 480
Freight rates—	
Excessive	Barrett, 51, 52
Discriminations in	Porter, 481, 482; Moseley, 516
Lower by river than by rail	Moseley, 517, 518
Round bales, refusal to reduce rates for	Barrett, 51
Holding for advance, not general	Kyle, 470, 474; Godwin, 476
Difficulty of	Redding, 444; Nunnally, 454
Insurance of	Moseley, 516, 517
Loans, Government loans on, advocated	Brown, 74
Long-staple cotton	Stubbs, 785
Loss in cultivation	Youmans, 117, 118; Hanley, 289
Louisiana	Stubbs, 775
Lowry bale	Stubbs, 787
Machinery little used	Redding, 453
Manufacture—	
American, increase of	Holmes, 161
Local effect on prices of cotton, and prosperity	Barrett, 58; Lovejoy, 76
South Carolina	Youmans, 119
Marketing of	Graham, 435, 436
Cost of	Hanley, 289
Georgia	Redding, 453; Peek, 461
Mississippi	Kyle, 473
North Carolina	White, 419
Tennessee	Godwin, 480; Porter, 480, 481

Cotton—Continued.		Page.
New uses for, demand increased by	Kyle, 466	
Peruvian	Stubbs, 786	
Planters' attempt to organize trust	Holmes, 159	
Pooling by railroads, competition destroyed by	Porter, 484	
Prices, advance in, beneficial effects	Redding, 444; Gage, 491; Moseley, 515	
Explained	Peek, 458; Kyle, 466	
Combinations believed to influence	Lovejoy, 76	
Cost of production, present rates below	Barrett, 49; Lovejoy, 75	
Credit system, effect of	Holmes, 160; Moseley, 516	
Decline in	Youmans, 118; Kyle, 466	
Credit system, cause of	Holmes, 160	
Crop-lien system, cause of	Barrett, 49	
After civil war	Youmans, 120	
Since 1872	Peek, 458	
Trusts, cause of	Graham, 435	
Determined in Liverpool and New York	Brown, 63	
Fluctuation seasonal	Moseley, 515, 516	
Low, effect of	Norfleet, 490, 491	
Manufacture, local, effect on	Barrett, 58; Lovejoy, 76	
New York, lower than local	Graham, 436	
Overproduction, effect	Barrett, 57, 58; Lovejoy, 76	
1870 to 1890	Norfleet, 485	
1894 to 1900	Redding, 444	
1895 to 1900	Godwin, 478-480	
1899	Porter, 483	
Production—		
Increase of	Holmes, 160, 162	
Overproduction of	Barrett, 51, 58; Lovejoy, 76; Hale, 393; Peek, 458	
Statistics of world production	Barrett, 57, 58	
Proportion to other crops, Georgia	Barrett, 56	
Round bales	Porter, 482, 483;	
Hutchinson, 509-512; Hitchcock, 685; Stubbs, 786		
Russia, production of	Hitchcock, 685	
Sea Island	Stubbs, 786, 787	
Soil, exhaustion where carelessly handled	Lovejoy, 78	
Speculation, prices, effect on	Barrett, 58; Brown, 74; Lovejoy, 76	
Tare	Barrett, 50; Brown, 63	
Tariff on manufactured cotton paid by planter	Brown, 64	
Transportation of	Moseley, 516-518	
Warehouses, bonded, advocated	Moseley, 516	
Water packed	Porter, 483	
Yield per acre—		
Alabama	Dillingham, 169	
Georgia	Nunnally, 451	
Mississippi	Kyle, 464, 465	
Tennessee	Edmonson, 501; Manson, 506	
Cotton-boll weevil	Howard, 757	
Cotton-boll worm	Howard, 757	
Cotton factors	Godwin, 480; Porter, 480, 481, 485; Norfleet, 488, 491	
Cotton goods, exports to the Orient, increase of	Hitchcock, 668	
Cotton Growers' Association, arrangements to hold cotton crop	Graham, 435	
Cotton-seed industry:		
Alabama	Poole, 926	
Fertilizers, use as	Dillingham, 169; Kyle, 466	
Prices of	Kyle, 465; Norfleet, 491	
Yield	Norfleet, 491	
Cotton-seed meal:		
Feed for cattle	Coles, 131	
Fertilizer, low grade	Hale, 380	
Cotton-seed oil:		
Exports, increase of	Hitchcock, 667	
Substitute for lard	Wedderburn, 634	
Value as salad oil	Kennicott, 533	
Cotton-seed oil cake and oil-cake meal, exports, distribution of	Hitchcock, 671	
Counselman, Charles:		
Elevators, relation to	Hill, 297, 306	
Grain dealings of	Hill, 319	
County fairs. (See <i>Fairs, agricultural</i> .)

Advocated	Redding, 451; Wieting, 994	
American and European contrasted	Davenport, 264	
Common schools, importance of in, discussed	Brigham, 12;	
Dye, 88; Ketchum, 134; True, 142-144; Dillingham, 167; Wil-		
son, 247; Davenport, 264-265; Hanley, 278; Crowell, 336; Hale,		
385; Clohan, 594-595; Nall, 813; Naftzger, 870; Stockwell, 887		
Criticised	Crowell, 336, 337	
High schools, instruction advocated	True, 141	
Importance	Bailey, 1013	
New York	Flanders, 995, 998	
Percentage of students taking agricultural course	Whitney, 868	
Reading courses for farmers	True, 142	
Salaries, large, influence of	Whitney, 868, 869	
Soils, chemistry of	Dye, 88, 89	
South Carolina	Hammond, 824, 830	
Southern States, necessity of	Brown, 62, 64	
World-wide movement for	True, 138	
Eggs, importation of	Ager, 115	
Egypt, agricultural college and experiments	True, 138	
Egyptian cotton	Stubbs, 785	
Electric railways. (See <i>Railroads</i> .)		
Elevator combinations	Brigham, 24; Moran, 717; Pratt, 724, 725; Prom, 800	
Chicago	Richards, 205, 216	
Effect of—		
All-canal elevators	Knapp, 1017	
Canal forwarders, Buffalo	Knapp, 1016, 1017	
Independent elevators	Kellogg, 1015, 1016	

Elevator combinations—Continued.		Page.
Elevate canal grain free	Kellogg,	1015
Legislation	Greeley,	943
Northwest	Greeley,	939, 940
Railroads, agreement with	Kellogg,	1015
Western Elevating Association, Buffalo	Kellogg,	1015-1016;
	Knapp,	1016-1017; Cook, 1017-1019
Elevators (see also Storage):		
California	Turnbull,	983, 985, 992
Card prices	Jumper,	736
Chicago—		
Branch elevators established by	Greeley,	233
Board of Trade examination prevented	Hill,	314
Cleaning houses	Hill,	299, 319
Country elevators, relation to	Hill,	318
Country shippers employed by	Richards,	205, 216, 217
Court decisions affecting	Hill,	298-302
Criticised	Richards, 202-206, 211, 213-217; Greeley,	227-235
Distributing inspector, appointment advocated	Hill,	311
Exports curtailed	Hill,	316
Farmers injured by	Hill,	318, 319
Grades manipulated by	Hill, 313, 314, 316, 318, 319	
History	Hill,	295, 313
Legislation, proposed by	Hill,	314, 317
Secured by corruption	Greeley,	233
Monopolistic character of	Hill, 297-302, 309, 310, 314, 316, 317	
Premiums demanded by warehousemen	Hill,	316, 319
Prices depressed by	Greeley,	228-234
Railroads, relation to	Hill, 295-297, 298, 303, 304, 308, 309	
Special bins not supervised	Hill,	312
Storage	Hill,	312, 314
Various methods of business described by Board of Trade committee	Hill,	310
Visible supplies abnormally increased	Hill,	315
Warehousemen, congestion of	Hill,	295, 297
Dealing in grain	Hill,	295-319
Proportion of grain owned by	Hill, 298, 315, 316	
Company	Wilson, 252, 253; Budge,	853, 854
Competition, North Dakota	Budge,	855
Cost of operation	Jumper,	738
Country buyers, Northwest	Greeley,	940
Discrimination	Prom,	789
Essential in grain industry	Budge,	843, 844
Farmers	Moran,	722, 723
In Northwest	Hanley, 279, 280, 282-285	
South Dakota	Jumper,	736
Government control advocated	Moran,	719
Grain dealing	Moran,	719
Independent	Jumper, 736; Prom,	797, 799
Legislation	Moran,	718, 719
Margins, South Dakota	Jumper,	732
Mixture of grades, prohibition advocated	Jones,	39
North Dakota	Prom, 795, 796; Budge,	856
Prices	Jumper, 736; Greeley, 939; Kellogg,	1015
Profits	Pratt, 726; Prom,	799, 800
Railroads, relation to	Moran,	721;
	Pratt, 725; Jumper, 737; Prom, 800; Greeley,	939, 940
Rebates. (See Discriminations.)		
Sale of futures by	Moran,	718
Shipping facilities, farmers have equal	Budge,	854
South Dakota	Jumper,	734, 735, 738
Speculation by	Moran, 719; Pratt,	728
Elgin Board of Trade, dairy products inspected by	Hamilton,	368
Elgin butter, not sold in Vermont	Vail,	415
Emerick, Professor, on agricultural discontent, statistics quoted	Crowell,	338
Emigration, Michigan	Smith,	566, 567
South Dakota to Canada	Jumper,	734

Fertilizers	Hamilton, 317; Poole, 920
Grain—	
Chicago, practices criticised	Richards, 203, 205, 206; Hill, 311, 312
Manipulation attempted	Powers, 190; Greeley, 233; Hill, 318
Minneapolis	Jumper, 784, 735
Optional proposed	Hitchcock, 680
Insect pests, State laws	Howard, 703
Meat—	
Bureau of Animal Industry	Salmon, 750
Exports increased by	Snow, 236
Federal, ineffective locally	Salmon, 747
Legislation proposed	Salmon, 745, 746
Local	Salmon, 750
Packing houses	Salmon, 742
Minnesota	Prom, 790, 801
Vessels for live-animal traffic	Salmon, 751
Institutes, farmers'. (See <i>Farmers' institutes</i>.)	
Insular possessions:	
Beet-sugar industry, how affected	Saylor, 587-589
Sugar, free, discussed	Wiley, 654
Insurance, fire-relief associations, New York.	Norris, 329
Intensive agriculture:	
Advantages of thorough cultivation	Hale, 392
Calhoun colored school, Alabama, instruction in	Dillingham, 169
Commercial fertilizers not used	Whitney, 882, 883
Defined	Stevens, 915
England	True, 111
Foreigners, New York	Norris, 323
Machinery, promoted by	Ketchum, 132; Davenport, 256
Progress sufficiently rapid in America	Crowe, 1, 341
Sugar beets, necessary for	Rogers, 550, 551;
Smith, 568, 578, 580; Saylor, 586; Wiley, 661	
Tendency toward not general	Holmes, 156
Tobacco, Connecticut	Whitney, 876, 877
Western States	Whitney, 883
Interest, rate of (see also <i>Banks; Loans; Mortgages</i>):	
Affected by character and resources of borrower	Powers, 189
Crop liens	Holmes, 151, 161
Excessive, paid by planters, South Carolina	Youmans, 118, 119
Southern States	Barrett, 47, 48; Brown, 64, 65, 67, 68, 73; Lovejoy, 78
Farm capital, 1889	Holmes, 154
Farm mortgages, 1890	Holmes, 154
Georgia	Hale, 381; Redding, 444; Peek, 463, 464; Stevens, 912
Influences fixing, increased knowledge of	Jones, 31
Legal, North Carolina	Graham, 436
Limited, North Carolina	White, 432
Loans	Brigham, 15
New Jersey	Coles, 130
South Dakota	Greeley, 335
Interstate commerce, original packages, food products, State control de-	
sired.	Flanders, 998
Interstate Commerce Commission:	
Discussed	Stubbs, 784
Effects, beneficial	Brigham, 37
Increased power, advocated	Bachelder, 41; Richards, 206, 209; Wilson, 251;
Peek, 463; Porter, 484; Miller, 619; Wedderburn, 635; Naftzger, 962	
Judicial and police powers proposed	Richards, 206, 207, 209, 211, 218, 219
Position of, criticised	Richards, 220
Rate-making power	Richards, 311; Naftzger, 962, 964
Southern California Fruit Exchange case before	Naftzger, 961
Interstate-commerce law:	
Amendments proposed	Richards, 206, 207, 209, 218, 219
Discriminations prevented by	Hamilton, 373; Richards, 204
Elevators, affected by	Greeley, 227
Chicago elevator system, relation to	Hill, 295, 313
Inadequacy of	Richards, 206
Patrons of Husbandry, influence of	Wilson, 254

	Page.
Interstate migration, North Dakota	Budge, 847
Interstate streams:	
Conflicts growing out of	Mead, 1064
State and Federal jurisdiction over	Mead, 1064
Iowa, grain prices lower than in Nebraska	Greeley, 233
Ireland, agricultural education in schools	Dillingham, 167
Irish:	
Character as farmers, New Jersey	Coles, 124
Compared with Irish in cities	Powers, 179-180
Irrigation (see also <i>Alkali</i> ; <i>Water rights</i>):	
Appropriations, Federal, for Western irrigation, deprecated	Brigham, 28
Artesian wells, California	Jones, 38
South Dakota	Naftzger, 953

California	Mead, 1061
Canada, irrigation code	Naftzger, 953
Canals, cementing of	Mead, 1060
Filling of	Mead, 1056
Citrus fruits	Mead, 1058
Cost	Naftzger, 953
Difficulties of	Whitney, 878, 879; Mead, 1065
Distribution of water, methods of	Whitney, 879
Egyptian cotton	Mead, 1055
Experiment stations, work in relation to	Stubbs, 785
Furrow, described	True, 147
Government aid	Mead, 1055
Great Salt Lake, effect on	Greeley, 933
Importance to Western areas	Whitney, 864
Interstate streams, conflicts of jurisdiction	Whitney, 878
Investigation by Department of Agriculture	Mead, 1064
Land irrigated, value of	Whitney, 880; Mead, 1055-1057
Legislation, national	Whitney, 878; Mead, 1065
State	Whitney, 880; Naftzger, 953
Montana and Colorado	Mead, 1064
Overdone	Powers, 182
Possibilities of	Whitney, 880
Poudre River system	Powers, 182; Naftzger, 951
Reservoirs, control, question of	Mead, 1054-1055
Necessity of	Mead, 1061-1062
Rice, Louisiana	Mead, 1061-1062
Seepage—	Stubbs, 772, 773
Alkali waters, Utah	Whitney, 862, 863
Losses from	Mead, 1055-1058
Protection against, Connecticut	Whitney, 864
Subirrigation	True, 150
Sugar beets	Saylor, 583, 588; Wiley, 646, 647
Tea culture, advocated in	Shepard, 441
Isthmian Canal:	
Favored by California fruit growers	Naftzger, 960, 965, 966, 967
Rates cheapened by	Naftzger, 960
Italians:	
Cotton growers, Mississippi	Kyle, 464, 467
Farm laborers in sugar-beet industry, New York	Norris, 324
Jamaica Canal, seepage of	Mead, 1055
Japan:	
Agricultural education and research	True, 138
Wheat market possible	Crowell, 343
Japanese labor:	
California	Saylor, 588, 590; Naftzger, 957; Turnbull, 969
Wages, effect on	Turnbull, 969
Jelly, adulteration of	Wedderburn, 633
Jersey cattle, not usually profitable	Magie, 101
Johnson grass, profits from, Georgia	Hale, 393
Jordan and Salt Lake Canal, seepage of	Mead, 1057
Kafir corn:	
Experiment stations, work in relation to	True, 149, 150
Production in Kansas	True, 150

	Page.
Kainite, price of	Hale, 389
Kalamazoo Sugar Company, Mich.	Smith, 509, 572
Kansas:	
Climatic conditions	Whitney, 861
Experiment station, work of	True, 150
Kansas Agricultural College, success of	Hale, 386
Kentucky:	
Crop sharing	Nall, 805
Diseases of animals	Nall, 811
Experiment station	Nall, 812
Farm labor	Nall, 803
Fertility	Nall, 811
Freight rates	Nall, 813

School facilities	Nall, 813, 814
School fund	Nall, 811
Stock raising	Nall, 807
Taxation	Nall, 811
Tobacco culture	Nall, 806
Labor, agricultural (see also <i>Child labor; Employment; Hours of labor;</i> <i>Negroes; Wages</i>):	
General conditions	Hanley, 274, 275; Poole, 921
California	Naftzger, 953
Illinois	Wilson, 243, 246
Kentucky	Nall, 806
Louisiana	Stubbs, 770
New England	Bachelder, 42
New Jersey	Ketchum, 133, 137
North Dakota	Budge, 846
South Carolina	Youmans, 117-118, 120, 122
Southern States	Lovejoy, 75
Vermont	Spear, 402
Character of —	
Efficiency	Greeley, 927
Maryland, southern	Whitney, 878
New Jersey	Coles, 124, 126
Vermont	Spear, 402, 404
Cheapness a detriment to South	Hale, 378
Cost under wage system and slavery compared	Hill, 505; Manson, 509
Farmers unskillful in making profit from hired labor	Bailey, 1013
Machinery—	
Effect upon skill required	Davenport, 256
Influence in decreasing severity of work	Brigham, 5; Jones, 33
Wage system better than tenancy	Redding, 448
Labor and capital, relations of, discussed	Brigham, 6, 9; Richards, 207, 208
Labor legislation, Alabama	Poole, 923, 924
Labor organizations:	
California	Turnbull, 972, 974, 975
Combination of sugar-beet thinners, Bay City, Mich.	Smith, 575
Legalization advocated	Richards, 208
Pacific Coast Council of Trades and Labor Federations	Turnbull, 974
Single tax favored by	Ralston, 1021
Laborers, agricultural:	
Acquisition of farms by	Coles, 124; Powers, 173, 179; Davenport, 256
Advantages of	Davenport, 256, 257
Age of	Powers, 173, 174, 179
Americans, West Virginia	Clohan, 592
Board, allowance for	Holmes, 152
Boarded by farmers	Powers, 174; Stockwell, 886
Chinese, California	Naftzger, 954
Cooperative arrangements, advantages	Jones, 34
Dairy, generally white	Stevens, 915
Farm-hand system, described	Stevens, 906, 907
Foreign born as	Greeley, 928
Better than Americans for sugar beets	Rogers, 555

	Page.
Laborers, agricultural—Continued.	
Foreign competition with, unfair	Wedderburn, 627-629
Foremen, New York	Norris, 321
Fruit growing and packing, Georgia	Hale, 375-377, 401
Homes, ownership of, by West Virginia	Clohan, 592
Independent farmers, tendency to become	Brigham, 7
West Virginia	Clohan, 593
Intelligence, improvement in	Norris, 321
Japanese, California	Naftzger, 957
Married men	Greeley, 928
Conditions of employment	Brigham, 9
Employed more than formerly	Davenport, 255
Migration—	
Cities, causes of	Ketchum, 137
Interstate	Brigham, 7
Nationality, Illinois and Michigan	Davenport, 255, 256
Organizations of farmers, membership in	Brigham, 6
Perquisites of	Stevens, 907
Proposed methods of improvement	Stevens, 906
Prospects of	Greeley, 929
Renting and cropping system, Southern States	Barrett, 47
Savings of	Moran, 711; Greeley, 928, 929
Social condition—	
Improvement	Jones, 33; Norris, 320
Minnesota	Haney, 275
West Virginia	Clohan, 594
South Carolina	Hammond, 821-822
Sugar-beet industry	Wiley, 632, 658
Thinning, Binghamton, N. Y.	Rogers, 555, 556
Tea pickers, South Carolina	Shepard, 441
Tenant houses, fuel, etc	Brigham, 9;
	Ager, 104-105; Powers, 174; Hale, 379; Stockwell, 885
Illinois	Wilson, 245
New Jersey	Dye, 84
New York	Norris, 321
Transient, Massachusetts	Stockwell, 885
White—	
Louisiana	Stubbs, 778
Southern States	Lovejoy, 79
Women, employment of, Georgia	Redding, 448
Laboring villages, improvement of, advocated	Nall, 815
Lake Shore and Michigan Southern Railroad, transfer houses, Chicago, operated by grain dealers	Greeley, 231
Land (see also <i>Arid land; Public lands; Swamp lands</i>):	
France, inheritance law	Ralston, 1029
Great Britain, farm	True, 144, 145
Private ownership, effects injurious	Ralston, 1028, 1029

Law, New York	Norris, 332; Flanders, 996, 997
Market for	Kennicott, 531
Production and exports, Netherlands	Hitchcock, 672, 678
Taxation, increase advocated	Brigham, 27;
	Bachelder, 44; Hamilton, 370, 371
Wholesomeness	Ager, 116; Hamilton, 368; Flanders, 997
Olive oil:	
California	Turnbull, 987
Cotton-seed oil in	Kennicott, 533
Omaha Exposition	Dodge, 692
"One-horse" farms, described	Stevens, 910
Options (see also Speculation):	
Bought largely by farmers, etc	Powers, 190
Grain	Moran, 723
Orange maggots	Howard, 756, 757
Orange worm, Mexican	Naftzger, 965
Oranges:	
California	Naftzger, 948; Turnbull, 984
Florida	Whitney, 862
Seedless, California	Naftzger, 948
Orchards, inspection of, Ohio	Miller, 618
Organizations of farmers (see also Combinations; Cooperation)	Greeley, 937,
	938; Stubbs, 782; Prom, 792
Agricultural implements, influence in securing better prices	Brigham, 18, 19
Beneficial effects	Dye, 94;
	Coles, 126; Ketchum, 135; Wilson, 250; Norris, 329; Crowell, 337
Causes of	Brigham, 18
Combinations—	
Effect in preventing extortion by	Brigham, 19, 20
Influence in compelling farmers to organize	Brigham, 18, 19
Discontinuance, South Dakota	Jumper, 787
Kentucky	Nall, 811

Organizations of farmers--Continued.		Page.
Massachusetts	Stockwell, 893	
Membership, increase	Brigham, 20	
Mississippi, lack of	Norfleet, 487	
North Dakota	Budge, 851	
Objects of	Davenport, 268, 268	
Ohio	Miller, 613	
Prices, influence, discussed	Brigham, 18, 19	
Southern States, advocated for	Brown, 66, 70	
Sugar-beet growers, Bay City, Mich	Smith, 577, 578	
Vermont	Spear, 405	
Virginia	Wedderburn, 634	
West Virginia	Clohan, 600	
Overproduction	Ager, 115; Stubbs, 782; Bailey, 1011	
Balance between supply and demand predicted	Ketchum, 135, 136	
Cotton	Holmes, 160; Hale, 393; Peek, 158	
Prices, relation to	Ketchum, 134, 135; Powers, 186; Norris, 326; Crowell, 343	
Rice and sugar	Stubbs, 782	
Wheat, effect on prices	Crowell, 343	
Ownership of farms	Moran, 710	
Advantage of	Davenport, 265, 266	
Desire of young men for, Georgia	Nunnally, 457	
Increase of	Powers, 170, 179	
Memphis district, by whites	Hill, 503	
Negroes, beneficial effects of	Dillingham, 166, 169	
North Carolina	White, 418, 419, 421, 422	
Relation to age	Powers, 173	
Restriction proposed	Peek, 463	
United States and Georgia, 1890	Peek, 460, 462	
Ownership of homes:		
Farm laborers, West Virginia	Peek, 460, 460; Clohan, 592	
Minnesota	Moran, 710	
Negroes and whites, Mississippi	Kyle, 469-471	
Oxnard, Cal., beet-sugar factory at	Saylor, 390	
Oxnard Sugar Trust, existence questioned	Smith, 581, 582	
Oyster culture, investigations by experiment stations	True, 147	
Pacific Ocean, conflict for ascendancy on	Crowell, 343	
Packing industry, development of	Hitchcock, 667	
Panic of 1893, speculation by elevator men the cause	Greely, 229	
Parasites, importation of	Howard, 761	
Paris Exposition of 1898	Wiley, 639	
Paternalism	Wiley, 644	
Partnerships, stock raising, Illinois, conditions of	Wilson, 245	
Patrons of Husbandry. (See <i>Grange</i> .)		
Peaches, consumption may be increased by better distribution	Hale, 393	
Georgia	Stevens, 917	
Maryland	Whitney, 877	
Overproduction prevented by freeze	Hale, 393	
Peas (see also <i>Leguminous crops</i>):		
Coloring artificial	Kennicott, 530	
Land improved by	Graham, 433; Wedderburn, 622	
Peavey, F. H., elevators purchased by	Richards, 205	
Pecos Canal, seepage of	Mead, 1056	
Peninsular Sugar Company, Caro. Mich	Smith, 567, 569	
Dairy and food commissioner	Hamilton, 347, 367	
Department of agriculture, organization explained	Hamilton, 347	
Diseases of animals, laws	Salmon, 749	
Experiment station, work of	True, 150	
Farmers' institutes	True, 142; Hamilton, 347, 349	
Fertility, maintenance of	Whitney, 871	
Forestry system	Hamilton, 361, 365	
Pure-food law, administration of	Hamilton, 367, 368	
Road system explained	Hamilton, 369, 370	
Tax system explained and criticised	Hamilton, 352-357	
Wages, farm, 1899	Hamilton, 349, 350	
Pennsylvania Dutch, excellence as farmers	Crowell, 333-335, 337	
Pennsylvania Railroad:		
Fruit transported by, north of Washington	Hale, 378, 398	
Transfer house, Chicago, operated by grain dealer	Greely, 232	

	Page.
Pennsylvania State College:	
Nature-study leaflets issued by	Hamilton, 351
Reading courses for farmers	True, 142

Poultry industry	Greeley, 937
Experiment stations, work of, in relation to	True, 147, 149
Vermont, united with dairy industry	Vail, 414
Poultrymen's Association, Vermont	Spear, 405
Prices	Stockwell, 891; Greeley, 936
Advance in—	
General	Burke, 201; Kyle, 467; Hill, 503
Causes—	
Export bounty advocated	Wedderburn, 626-632
Opening up Western land	Ketchum, 135
Protection	Wedderburn, 624, 625
Puts and calls	Powers, 190
Speculation	Jumper, 737
Trusts	Miller, 615; Wedderburn, 624, 625
Competition, bonanza farming less injurious than small competitors	Brigham, 17, 18
Decline in	Brigham, 17; Youmans, 118; Coles, 122-127; Holmes, 155, 156; Wilson, 248, 249; Davenport, 267; Norris, 326; Crowell, 341-343; Hale, 388, 389; Norfleet, 485; Wieting, 993, 994
Causes—	
Cheapened production	Davenport, 267
Increase of acreage, not due to	Hanley, 279
Migration to cities	Peck, 459
Overproduction	Ketchum, 134, 135
Western competition	Hamilton, 367
Speculation	Graham, 435; Wedderburn, 632
Depression of agricultural, effect on	Graham, 433, 438
Determining of	Hyde, 841, 842
Competition	Crowell, 339
Cost of production	Powers, 175, 176
Export price	Hanley, 288
Foreign markets	Brigham, 21
Liverpool	Wedderburn, 630; Moran, 512
Elevators, manipulation by	Richards, 216; Jumper, 736; Prom, 500
Grain—	
Depressed by congestion in Chicago elevators	Hill, 313, 315
Fixed in Chicago	Greeley, 233, 234, 235
Higher in Nebraska than in Iowa	Greeley, 233
Lowest when farmers sell	Hanley, 286
Manipulated by elevator men	Richards, 216
High during civil war, causes	Wieting, 993
Land—	
Maryland	Ager, 109
Northwest	Greeley, 937
Law governing	Powers, 186
Liverpool market, influences affecting	Brigham, 21
Low	Ager, 109
Benefits of	Wiley, 654
General prevalence of	Youmans, 118
Milk—	
Wholesale, New Jersey	Magie, 100, 101
Retail, New York	Magie, 102, 103
Organizations of farmers, possible influence on, discussed	Brigham, 29
Overproduction, relation to	Brigham, 17, 21; Ketchum, 134, 135; Powers, 186

Yield per acre—	
Increase predicted	Wiley, 665
Michigan	Kedzie, 542, 547; Smith, 568
New York	Rogers, 551, 552
Various countries	Wiley, 656, 664
Sugar-cane industry	Stubbs, 774
Florida and Texas, production unimportant	Wiley, 649
Georgia	Redding, 450; Stevens, 917

	Page.
Sugar-cane industry—Continued.	
Hawaii, yield per acre	Wiley, 654
Subsidy, British West Indies	Wiley, 664
Sugar industry	Stubbs, 777
Beet sugar (see also <i>Sugar-beet culture</i>):	
Bounties	Powers, 176, 177; Wedderburn, 630
Germany	Wiley, 653, 655, 658, 661
Michigan	Kedzie, 533, 536, 540-543
National, discussed	Saylor, 590
New York	Rogers, 551, 557, 558, 560; Flanders, 997
State, opposed	Saylor, 589, 590
By-products, utilization of	Kedzie, 539, 548; Saylor, 586, 587
California	Naftzger, 950, 951; Turnbull, 978-981
Cost of production, American and European compared	Wiley, 640, 655
Diminution predicted	Saylor, 587, 588
Countervailing duty on	Wiley, 653
Development of industry	Snow, 241, 242
Factories—	
American Beet Sugar Company	Saylor, 590
Cooperation	Wiley, 663, 664
Establishment, early in United States	Wiley, 639
Effects of, Michigan	Smith, 573, 574
Foreigners employed in, Michigan	Smith, 570
Limestone and coal necessary	Rogers, 550
Number, in various States	Saylor, 585, 586; Wiley, 650, 651
Germany	Wiley, 656
Policies of	Turnbul, 979
Refining by	Rogers, 559
Relations to farmers	Wiley, 663, 664
Michigan	Kedzie, 544-546; Smith, 571-574, 576-581
New York	Rogers, 561
Season, length of	Saylor, 583; Wiley, 610
New York	Rogers, 553, 555, 558, 561
Substations and pipe lines, Utah	Saylor, 585-586
History of	Wiley, 638
Imports	Wiley, 653
Inferior to cane for preserving	Wiley, 650
Investments, exemption from taxation advocated	Saylor, 590
Juice pumped through pipe lines, Utah	Saylor, 585, 586
Lime, slaked, used as fertilizer, Michigan	Smith, 573
Machinery, American and foreign compared	Kedzie, 543, 544;
	Rogers, 558, 559; Smith, 569, 570, 582; Wiley, 610
Tariff on	Rogers, 559
Molasses—	
Process for recovering sugar from, Germany	Saylor, 587; Wiley, 657
Utilization of	Rogers, 554
Germany	Wiley, 657
Wasted, Michigan	Smith, 573
Possibility of supplying entire demand for sugar	Brigham, 22
Price, wholesale, Germany	Wiley, 656
Product per ton of beets, Michigan	Smith, 569, 581
Profitableness	Turnbull, 978, 980
Pulp, value as feed	Smith, 573; Saylor, 586, 587
Refining unnecessary	Kedzie, 513
Saccharine yield of beets, California	Turnbull, 981
Tariff on	Wiley, 653
Trust. (See <i>Sugar trust</i> .)	
Cane sugar	Saylor, 587
Cuba, production	Wiley, 653
Cost of production, Cuba, Porto Rico, and Hawaii	Saylor, 587
Louisiana, greater than in Tropics	Saylor, 589
Louisiana	Saylor, 589; Wiley, 649; Stubbs, 771, 772
Superior to beet for preserving	Wiley, 650
Yield per acre, Hawaii	Saylor, 589
Consumption	Snow, 241;
	Kedzie, 543, 544; Rogers, 555; Wiley, 649, 650; Stubbs, 773
Increase of	Saylor, 589

Sugar industry—Continued.		Page.
Consumption—Continued.		
Per capita—		
England	Wiley, 650	
Germany	Wiley, 658-661	
United States	Rogers, 562	
Development of	Snow, 241, 242	
Experiment stations	True, 130, 149; Stubbs, 780	
Factories closing on alkali lands	Whitney, 809	
Free, from Porto Rico, Cuba, and Philippines discussed	Wiley, 654	
Hawaii, production stimulated by reciprocity	Snow, 241	
Houses, Louisiana	Stubbs, 771	
Imports, United States	Snow, 241	
Laws, Germany	Wiley, 658-661	
Maple, adulterated with cane sugar	Spear, 408	
Overproduction	Stubbs, 782	
Philippine Islands, tariff on, discussed	Snow, 241, 242	
Planters, Louisiana	Stubbs, 781	
Prices	Wedderburn, 624, 625; Stubbs, 771	
Production	Kedzie, 543, 544	
Cheapened, Louisiana	Wiley, 654	
New York	Rogers, 555	
United States	Wiley, 649, 650	
Profit	Stubbs, 775	
Schools	Stubbs, 778	
Tariff	Snow, 241, 242; Stubbs, 773, 774, 775	
Continuance advocated	Saylor, 599	
Permanent, unnecessary	Kedzie, 543	
Taxation of, Germany	Wiley, 655, 658-661	
Trust. (See <i>Sugar trust</i> .)		
Sugar Planters' Association	Stubbs, 783	
Financial assistance to Louisiana experiment stations	True, 140, 149	
Sugar trust:		
Beet sugar—		
Control of, denied	Kedzie, 543, 544	
Existence questioned	Smith, 581, 582; Saylor, 590	
Factories, independent of	Wiley, 655	
Free sugar from Hawaii and Porto Rico, effect on	Saylor, 599	
Louisiana	Stubbs, 771, 772	
Price increased by	Wedderburn, 624, 625	
Sumatra tobacco, in Connecticut	Wieting, 870, 876	
Summer schools, advocated	Dye, 90	
Supply and demand, of agricultural products, balance between, pre-		
dicted	Ketchum, 135, 136	
Surplus, price fixed by	Wedderburn, 630	
Swamp lands		Pool, 924
Area and value	Whitney, 864	
Drainage of, Ohio	Miller, 608	
Legislation necessary, Marshfield, Mass	Whitney, 882	
Reclamation—		
Desirability of	Whitney, 881	
Hollanders, New York	Norris, 323	
Long Island	Whitney, 881	
Sweden, butter, exports of	Hitchcock, 674	
Tariff		Stockwell, 900, 901
Advocated	Coles, 123, 131; Naftzger, 965	
Attitude of farmers toward	Hale, 397; Stockwell, 902	
Effect on farmers discussed	Wedderburn, 624, 626; Bailey, 1011	
Extension to farmers by bounty on exports	Peck, 463	
Hemp growing	Nall, 815	
Hides, aid to cattle raisers	Greeley, 942
